Have there, in very deed, been ages, in which the external conditions of poetry such as Rossetti's were of more spontaneous growth than in our own? The archaic side of Rossetti's work, his preferences in regard to earlier poetry, connect him with those who have certainly thought so, who fancied they could have breathed more largely in the age of Chaucer, or of Ronsard,[22] in one of those ages, in the words of Stendhal — *ces siècles de passions où les âmes pouvaient se livrer franchement à la plus haute exaltation, quand les passions qui font la possibilité comme les sujets des beaux arts existaient.*[23] We may think, perhaps, that such old time as that has never really existed except in the fancy of poets; but it was to find it, that Rossetti turned so often from modern life to the chronicle of the past. Old Scotch history, perhaps beyond any other, is strong in the matter of heroic and vehement hatreds and love, the tragic Mary herself being but the perfect blossom of them; and it is from that history that Rossetti has taken the subjects of the two longer ballads of his second volume: of the three admirable ballads in it, *The King's Tragedy* (in which Rossetti has dexterously interwoven some relics of James's[24] own exquisite early verse) reaching the highest level of dramatic success, and marking perfection, perhaps, in this kind of poetry; which, in the earlier volume, gave us, among other pieces, *Troy Town*, *Sister Helen*, and *Eden Bower*.

Like those earlier pieces, the ballads of the second volume bring with them the question of the poetic value of the 'refrain' —[25]

> 'Eden bower's in flower:
> And O the bower and the hour!'

— and the like. Two of those ballads — *Troy Town* and *Eden Bower*, are terrible in theme; and the refrain serves, perhaps, to relieve their bold aim at the sentiment of terror. In *Sister Helen* again, the refrain has a real, and sustained purpose (being here duly varied also) and performs the part of a chorus, as the story proceeds. Yet even in these cases, whatever its effect may be in actual recitation, it may fairly be questioned, whether, to the mere reader their actual effect is not that of a positive interruption and drawback, at least in pieces so lengthy; and Ros-

21. *Gnomic*: aphoristic, or proverbial in style.
22. Pierre de Ronsard (1524–85), French poet.
23. 'those ages full of passion, when the spirits of men could release themselves freely to the highest pitch of exaltation, when the passions were alive that are possible subjects for the fine arts.' *Cf.* Stendhal, *Histoire de la peinture en Italie*, in his *Œuvres*, ed. Paris, 1924, IV,28.
24. James I (1394–1437), king of Scotland.
25. See the ballad 'Eden Bower,' where each of these two lines, used alternately, serves as refrain.

setti himself, it would seem, came to think so, for in the shortest of his later ballads, *The White Ship* — that old true history of the generosity with which a youth, worthless in life, flung himself upon death — he was contented with a single utterance of the refrain, 'given out' like the keynote or tune of a chant.

In *The King's Tragedy*, Rossetti has worked upon motive, broadly human (to adopt the phrase of popular criticism) such as one and all may realise. Rossetti, indeed, with all his self-concentration upon his own peculiar aim, by no means ignored those general interests which are external to poetry as he conceived it; as he has shown here and there, in this poetic, as also in pictorial, work. It was but that, in a life to be shorter even than the average, he found enough to occupy him in the fulfilment of a task, plainly 'given him to do.' Perhaps, if one had to name a single composition of his to readers desiring to make acquaintance with him for the first time, one would select: *The King's Tragedy* — that poem so moving, so popularly dramatic, and lifelike. Notwithstanding this, his work, it must be conceded, certainly through no narrowness or egotism, but in the faithfulness of a true workman to a vocation so emphatic, was mainly of the esoteric order. But poetry, at all times, exercises two distinct functions: it may reveal, it may unveil to every eye, the ideal aspects of common things, after Gray's way (though Gray too, it is well to remember, seemed in his own day, seemed even to Johnson,[26] obscure) or it may actually add to the number of motives poetic and uncommon in themselves, by the imaginative creation of things that are ideal from their very birth. Rossetti did something, something excellent, of the former kind; but his characteristic, his really revealing work, lay in the adding to poetry of fresh poetic material, of a new order of phenomena, in the creation of a new ideal.

26. *Cf.* Johnson, 'Life of Gray,' in his *The Lives of the . . . Poets*, ed. 1896, III,276.

Postscript

αἰνεῖ δὲ παλαιὸν μὲν οἶνον, ἄνθεα δ' ὕμνων νεωτέρων[1]

THE words, *classical* and *romantic*, although, like many other critical expressions, sometimes abused by those who have understood them too vaguely or too absolutely, yet define two real tendencies in the history of art and literature. Used in an exaggerated sense, to express a greater opposition between those tendencies than really exists, they have at times tended to divide people of taste into opposite camps. But in that *House Beautiful*,[2] which the creative minds of all generations — the artists and those who have treated life in the spirit of art — are always building together, for the refreshment of the human spirit, these oppositions cease; and the *Interpreter* of the *House Beautiful*, the true æsthetic critic, uses these divisions, only so far as they enable him to enter into the peculiarities of the objects with which he has to do. The term *classical*, fixed, as it is, to a well-defined literature, and a well-defined group in art, is clear, indeed; but then it has often been used in a hard, and merely scholastic sense, by the praisers of what is old and accustomed, at the expense of what is new, by critics who would never have discovered for themselves the charm of any work, whether new or old, who value what is old, in art or literature, for its accessories, and chiefly for the conventional authority that has gathered about it — people who would never really have been made glad by any Venus fresh-risen from the sea,

1. 'While thou praisest the wine that is old, thou shalt also praise the flowers of songs that are new.' *Cf.* Pindar, *Olympian Odes*, IX,48–9 (trans. Sandys).

2. The phrase alludes to the House Beautiful of Bunyan's *Pilgrim's Progress*.

and who praise the Venus of old Greece and Rome, only because they fancy her grown now into something staid and tame.

And as the term, *classical*, has been used in a too absolute, and therefore in a misleading sense, so the term, *romantic*, has been used much too vaguely, in various accidental senses. The sense in which Scott is called a romantic writer is chiefly this; that, in opposition to the literary tradition of the last century, he loved strange adventure, and sought it in the Middle Age. Much later, in a Yorkshire village, the spirit of romanticism bore a more really characteristic fruit in the work of a young girl, Emily Brontë, the romance of *Wuthering Heights*;[3] the figures of Hareton Earnshaw, of Catherine Linton, and of Heathcliffe — tearing open Catherine's grave, removing one side of her coffin, that he may really lie beside her in death — figures so passionate, yet woven on a background of delicately beautiful, moorland scenery, being typical examples of that spirit. In Germany, again, that spirit is shown less in Tieck, its professional representative, than in Meinhold, the author of *Sidonia the Sorceress* and the *Amber-Witch*.[4] In Germany and France, within the last hundred years, the term has been used to describe a particular school of writers; and, consequently, when Heine[5] criticises the *Romantic School* in Germany — that movement which culminated in Goethe's *Goetz von Berlichingen*;[6] or when Théophile Gautier[7] criticises the romantic movement in France, where, indeed, it bore its most characteristic fruits, and its play is hardly yet over where, by a certain audacity, or *bizarrerie*[8] of motive, united with faultless literary execution, it still shows itself in imaginative literature, they use the word, with an exact sense of special artistic qualities, indeed; but use it, nevertheless, with a limited application to the manifestation of those qualities at a particular period. But the romantic spirit is, in reality, an ever-present, an enduring principle, in the artistic temperament; and the qualities of thought and style which that, and other similar uses of the word *romantic* really indicate, are indeed but symptoms of a very continuous and widely working influence.

Though the words *classical* and *romantic*, then, have acquired an almost technical meaning, in application to certain developments of German and French taste, yet this is but one variation of an old opposition, which may be traced from the very beginning of the formation of European art and literature. From the first formation of anything like a standard of taste in these things, the restless curiosity of their more eager lovers necessarily made itself felt, in the craving for new motives, new subjects of interest, new modifications of style. Hence, the opposition between the classicists and the romanticists — between the adherents, in the culture of beauty, of the principles of liberty, and authority, respectively — of strength, and order or what the Greeks called κοσμιότης.[9]

Sainte-Beuve, in the third volume of the *Causeries du Lundi*, has discussed the question, *What is meant by a classic?* It was a question he was well fitted to an-

9. 'orderly, decorous behavior.'

swer, having himself lived through many phases of taste, and having been in earlier life an enthusiastic member of the romantic school: he was also a great master of that sort of 'philosophy of literature,' which delights in tracing traditions in it, and the way in which various phases of thought and sentiment maintain themselves, through successive modifications, from epoch to epoch. His aim, then, is to give the word *classic* a wider and, as he says, a more generous sense than it commonly bears, to make it expressly *grandiose et flottant*;[10] and, in doing this, he develops, in a masterly manner, those qualities of measure, purity, temperance, of which it is the especial function of classical art and literature, whatever meaning, narrower or wider, we attach to the term, to take care.

The charm, therefore, of what is classical, in art or literature, is that of the well-known tale, to which we can, nevertheless, listen over and over again, because it is told so well. To the absolute beauty of its artistic form, is added the accidental, tranquil, charm of familiarity. There are times, indeed, at which these charms fail to work on our spirits at all, because they fail to excite us. '*Romanticism*,' says Stendhal,[11] 'is the art of presenting to people the literary works which, in the actual state of their habits and beliefs, are capable of giving them the greatest possible pleasure; *classicism*, on the contrary, of presenting them with that which gave the greatest possible pleasure to their grandfathers.' But then, beneath all changes of habits and beliefs, our love of that mere abstract proportion — of music — which what is classical in literature possesses, still maintains itself in the best of us, and what pleased our grandparents may at least tranquillise us. The 'classic' comes to us out of the cool and quiet of other times, as the measure of what a long experience has shown will at least never displease us. And in the classical literature of Greece and Rome, as in the classics of the last century, the essentially classical element is that quality of order in beauty, which they possess, indeed, in a pre-eminent degree, and which impresses some minds to the exclusion of everything else in them.

It is the addition of strangeness to beauty, that constitutes the romantic character in art; and the desire of beauty being a fixed element in every artistic organisation, it is the addition of curiosity to this desire of beauty, that constitutes the romantic temper. Curiosity and the desire of beauty, have each their place in art, as in all true criticism. When one's curiosity is deficient, when one is not eager enough for new impressions, and new pleasures, one is liable to value mere academical proprieties too highly, to be satisfied with worn-out or conventional types, with the insipid ornament of Racine,[12] or the prettiness of that later Greek sculpture, which passed so long for true Hellenic work: to miss those places where the handiwork of nature, or of the artist, has been most cunning; to find the most stimulating products of art a mere irritation. And when one's curiosity is in excess, when it overbalances the desire of beauty, then one is liable to value in works of art what is inartistic in them; to be satisfied with what is exaggerated in art, with productions like some of those of the romantic school in Germany; not to distinguish, jealously enough, between what is admirably done, and what is done not quite so well, in the writings, for instance, of Jean Paul.[13] And if I had to give instances of these defects, then I should say, that Pope, in common

13. Jean Paul Richter (1763–1825), German humorist and satiric novelist of the romantic school.

with the age of literature to which he belonged, had too little curiosity, so that there is always a certain insipidity in the effect of his work, exquisite as it is; and, coming down to our own time, that Balzac [14] had an excess of curiosity — curiosity not duly tempered with the desire of beauty.

But, however falsely those two tendencies may be opposed by critics, or exaggerated by artists themselves, they are tendencies really at work at all times in art, moulding it, with the balance sometimes a little on one side, sometimes a little on the other, generating, respectively, as the balance inclines on this side or that, two principles, two traditions, in art, and in literature so far as it partakes of the spirit of art. If there is a great overbalance of curiosity, then, we have the grotesque in art: if the union of strangeness and beauty, under very difficult and complex conditions, be a successful one, if the union be entire, then the resultant beauty is very exquisite, very attractive. With a passionate care for beauty, the romantic spirit refuses to have it unless the condition of strangeness be first fulfilled. Its desire is for a beauty born of unlikely elements, by a profound alchemy, by a difficult initiation, by the charm which wrings it even out of terrible things; and a trace of distortion, of the grotesque, may perhaps linger, as an additional element of expression, about its ultimate grace. Its eager, excited spirit will have strength, the grotesque, first of all — the trees shrieking as you tear off the leaves; [15] for Jean Valjean, the long years of convict life; for Redgauntlet, the quicksands of Solway Moss; [16] then, incorporate with this strangeness, and intensified by restraint, as much sweetness, as much beauty, as is compatible with that. *Énergique, frais, et dispos* — these, according to Sainte-Beuve, are the characteristics of a genuine classic — *les ouvrages anciens ne sont pas classiques parce qu'ils sont vieux, mais parce qu'ils sont énergiques, frais, et dispos.*[17] Energy, freshness, intelligent and masterly disposition: — these are characteristics of Victor Hugo when his alchemy is complete, in certain figures, like Marius and Cosette,[18] in certain scenes, like that in the opening of *Les Travailleurs de la Mer*, where Déruchette writes the name of *Gilliatt* in the snow, on Christmas morning; but always there is a certain note of strangeness discernible there, as well.

The essential elements, then, of the romantic spirit are curiosity and the love of beauty; and it is only as an illustration of these qualities, that it seeks the Middle Age, because, in the overcharged atmosphere of the Middle Age, there are unworked sources of romantic effect, of a strange beauty, to be won, by strong imagination, out of things unlikely or remote.

Few, probably, now read Madame de Staël's *De l'Allemagne*, though it has its interest, the interest which never quite fades out of work really touched with the enthusiasm of the spiritual adventurer, the pioneer in culture. It was published in 1810, to introduce to French readers a new school of writers — the romantic school, from beyond the Rhine; and it was followed, twenty-three years later, by Heine's *Romantische Schule*, as at once a supplement and a correction. Both these books, then, connect romanticism with Germany, with the names especially of Goethe and Tieck; and, to many English readers, the idea of romanticism is still inseparably connected with Germany — that Germany which, in its quaint old towns, under the spire of Strasburg or the towers of Heidelberg, was always listening in rapt inac-

tion to the melodious, fascinating voices of the Middle Age, and which, now that it has got Strasburg back again,[19] has, I suppose, almost ceased to exist. But neither Germany, with its Goethe and Tieck, nor England, with its Byron and Scott, is nearly so representative of the romantic temper as France, with Murger,[20] and Gautier, and Victor Hugo. It is in French literature that its most characteristic expression is to be found; and that, as most closely derivative, historically, from such peculiar conditions, as ever reinforce it to the utmost.

For, although temperament has much to do with the generation of the romantic spirit, and although this spirit, with its curiosity, its thirst for a curious beauty, may be always traceable in excellent art (traceable even in Sophocles) yet still, in a limited sense, it may be said to be a product of special epochs. Outbreaks of this spirit, that is, come naturally with particular periods — times, when, in men's approaches towards art and poetry, curiosity may be noticed to take the lead, when men come to art and poetry, with a deep thirst for intellectual excitement, after a long *ennui*, or in reaction against the strain of outward, practical things: in the later Middle Age, for instance; so that medieval poetry, centering in Dante, is often opposed to Greek and Roman poetry, as romantic poetry to the classical. What the romanticism of Dante is, may be estimated, if we compare the lines in which Virgil describes the hazel-wood, from whose broken twigs flows the blood of Polydorus, not without the expression of a real shudder at the ghastly incident, with the whole canto of the *Inferno*, into which Dante has expanded them,[21] beautifying and softening it, meanwhile, by a sentiment of profound pity. And it is especially in that period of intellectual disturbance, immediately preceding Dante, amid which the romance languages[22] define themselves at last, that this temper is manifested. Here, in the literature of Provence,[23] the very name of *romanticism* is stamped with its true signification: here we have indeed a romantic world, grotesque even, in the strength of its passions, almost insane in its curious expression of them, drawing all things into its sphere, making the birds, nay! lifeless things, its voices and messengers, yet so penetrated with the desire for beauty and sweetness, that it begets a wholly new species of poetry, in which the *Renaissance* may be said to begin. The last century was preeminently a classical age, an age in which, for art and literature, the element of a comely order was in the ascendant; which, passing away, left a hard battle to be fought between the classical and the romantic schools. Yet, it is in the heart of this century, of Goldsmith and Stothard, of Watteau and the *Siècle de Louis XIV*,[24] — in one of its central, if not most characteristic figures, in Rousseau — that the modern or French romanticism really originates. But, what in the eighteenth century is but an exceptional phenomenon, breaking through its fair reserve and discretion only at rare intervals, is the habitual guise of the nineteenth, breaking through it perpetually, with a feverish-

24. Thomas Stothard (1755–1834), English painter, interior decorator, book-illustrator; Jean Antoine Watteau (1684–1721), French painter of delicate landscapes with richly delicate costumes for the shepherdesses, etc.; Voltaire's account of the Age of Louis XIV appeared in 1751.

ness, an incomprehensible straining and excitement, which all experience to some degree, but yearning also, in the genuine children of the romantic school, to be *énergique, frais, et dispos* — for those qualities of energy, freshness, comely order; and often, in Murger, in Gautier, in Victor Hugo, for instance, with singular felicity attaining them.

It is in the terrible tragedy of Rousseau, in fact, that French romanticism, with much else, begins: reading his *Confessions* we seem actually to assist at the birth of this new, strong spirit in the French mind. The wildness which has shocked so many, and the fascination which has influenced almost every one, in the squalid, yet eloquent figure, we see and hear so clearly in that book, wandering under the appleblossoms and among the vines of Neuchâtel or Vevey [25] actually give it the quality of a very successful romantic invention. His strangeness or distortion, his profound subjectivity, his passionateness — the *cor laceratum* — [26] Rousseau makes all men in love with these. *Je ne suis fait comme aucun de ceux que j'ai sus. Mais si je ne vaux pas mieux, au moins je suis autre.* — 'I am not made like any one else I have ever known: yet, if I am not better, at least I am different.' These words, from the first page of the *Confessions*, anticipate all the Werthers, Renés, Obermanns,[27] of the last hundred years. For Rousseau did but anticipate a trouble in the spirit of the whole world: and thirty years afterwards, what in him was a peculiarity, became part of the general consciousness. A storm was coming: Rousseau, with others, felt it in the air, and they helped to bring it down: they introduced a disturbing element into French literature, then so trim and formal, like our own literature of the age of Queen Anne.

In 1815 the storm had come and gone, but had left, in the spirit of 'young France,' the *ennui* of an immense disillusion. In the last chapter of Edgar Quinet's *Révolution Française*,[28] a work itself full of irony, of disillusion, he distinguishes two books, Senancour's *Obermann* and Chateaubriand's *Génie du Christianisme*,[29] as characteristic of the first decade of the present century. In those two books we detect already the disease and the cure — in *Obermann* the irony, refined into a plaintive philosophy of 'indifference' — in Chateaubriand's *Génie du Christianisme*, the refuge from a tarnished actual present, a present of disillusion, into a world of strength and beauty in the Middle Age, as at an earlier period — in *René* and *Atala* [30] — into the free play of them in savage life. It is to minds in this spiritual situation, weary of the present, but yearning for the spectacle of beauty and strength, that the works of French romanticism appeal. They set a positive value on the intense, the exceptional; and a certain distortion is sometimes noticeable in them, as in conceptions like Victor Hugo's *Quasimodo*, or *Gwynplaine*,[31] something of a terrible grotesque, of the *macabre*, as the French themselves call it; though always combined with perfect literary execution, as in Gautier's *La Morte Amoureuse*, or the scene of the 'maimed' burial-rites of the player, dead of the frost, in his *Capitaine Fracasse* — true 'flowers of the yew.' It becomes grim humour in Victor Hugo's combat of Gilliatt with the

devil-fish,[32] or the incident, with all its ghastly comedy drawn out at length, of the great gun detached from its fastenings on shipboard, in *Quatre-Vingt-Treize* (perhaps the most terrible of all the accidents that can happen by sea) and in the entire episode, in that book, of the *Convention*. Not less surely does it reach a genuine pathos; for the habit of noting and distinguishing one's own most intimate passages of sentiment makes one sympathetic, begetting, as it must, the power of entering, by all sorts of finer ways, into the intimate recesses of other minds; so that pity is another quality of romanticism, both Victor Hugo and Gautier being great lovers of animals, and charming writers about them, and Murger being unrivalled in the pathos of his *Scènes de la Vie de Jeunesse*. Penetrating so finely into all situations which appeal to pity, above all, into the special or exceptional phases of such feeling, the romantic humour is not afraid of the quaintness or singularity of its circumstances or expression, pity, indeed, being of the essence of humour; so that Victor Hugo does but turn his romanticism into practice, in his hunger and thirst after practical *Justice*! — a justice which shall no longer wrong children, or animals, for instance, by ignoring in a stupid, mere breadth of view, minute facts about them. Yet the romanticists are antinomian,[33] too, sometimes, because the love of energy and beauty, of distinction in passion, tended naturally to become a little *bizarre*, plunging into the Middle Age, into the secrets of old Italian story. *Are we in the Inferno?* — we are tempted to ask, wondering at something malign in so much beauty. For over all a care for the refreshment of the human spirit by fine art manifests itself, a predominant sense of literary charm, so that, in their search for the secret of exquisite expression, the romantic school went back to the forgotten world of early French poetry, and literature itself became the most delicate of the arts — like 'goldsmith's work,' says Sainte-Beuve,[34] of Bertrand's *Gaspard de la Nuit* [35] — and that peculiarly French gift, the gift of exquisite speech, *argute loqui*,[36] attained in them a perfection which it had never seen before.

Stendhal, a writer whom I have already quoted, and of whom English readers might well know much more than they do, stands between the earlier and later growths of the romantic spirit. His novels are rich in romantic quality; and his other writings — partly criticism, partly personal reminiscences — are a very curious and interesting illustration of the needs out of which romanticism arose. In his book on *Racine and Shakespeare*, Stendhal argues that all good art was romantic in its day; and this is perhaps true in Stendhal's sense. That little treatise, full of 'dry light' and fertile ideas, was published in the year 1823, and its object is to defend an entire independence and liberty in the choice and treatment of subject, both in art and literature, against those who upheld the exclusive authority of precedent. In pleading the cause of romanticism, therefore, it is the novelty, both of form and of motive, in writings like the *Hernani* of Victor Hugo (which soon followed it, raising a storm of criticism) that he is chiefly concerned to justify. To be interesting and really stimulating, to keep us from yawning even, art and literature must follow the subtle movements of that nimbly-shifting *Time-Spirit*, or *Zeit-Geist*, understood by French not less than by German criticism, which is always modifying men's taste, as it modifies their manners and their pleasures. This, he contends, is what all great workmen had always understood. Dante, Shakespeare, Molière, had exercised an absolute independence in

32. In his *Toilers of the Sea*.

34. *Cf.* Sainte-Beuve, *Portraits Littéraires*, new ed., II,355.

35. A series of prose ballads, published in 1842, written by Louis-Jacques-Napoléon Bertrand (1807–41).

36. 'to speak impressively.'

their choice of subject and treatment. To turn always with that ever-changing spirit, yet to retain the flavour of what was admirably done in past generations, in the classics, as we say — is the problem of true romanticism. 'Dante,' he observes,[37] 'was pre-eminently the romantic poet. He adored Virgil, yet he wrote the *Divine Comedy*, with the episode of Ugolino,[38] which is as unlike the *Æneid* as can possibly be. And those who thus obey the fundamental principle of romanticism, one by one become classical, and are joined to that ever-increasing common league, formed by men of all countries, to approach nearer and nearer to perfection.'

Romanticism, then, although it has its epochs, is in its essential characteristics rather a spirit which shows itself at all times, in various degrees, in individual workmen and their work, and the amount of which criticism has to estimate in them taken one by one, than the peculiarity of a time or a school. Depending on the varying proportion of curiosity and the desire of beauty, natural tendencies of the artistic spirit at all times, it must always be partly a matter of individual temperament. The eighteenth century in England has been regarded as almost exclusively a classical period; yet William Blake, a type of so much which breaks through what are conventionally thought the influences of that century, is still a noticeable phenomenon in it, and the reaction in favour of naturalism in poetry begins in that century, early. There are, thus, the born romanticists and the born classicists. There are the born classicists who start with *form*, to whose minds the comeliness of the old, immemorial, well-recognised types in art and literature, have revealed themselves impressively; who will entertain no matter which will not go easily and flexibly into them; whose work aspires only to be a variation upon, or study from, the older masters. ''Tis art's decline, my son!'[39] they are always saying, to the progressive element in their own generation; to those who care for that which in fifty years' time every one will be caring for. On the other hand, there are the born romanticists, who start with an original, untried *matter*, still in fusion; who conceive this vividly, and hold by it as the essence of their work; who, by the very vividness and heat of their conception, purge away, sooner or later, all that is not organically appropriate to it, till the whole effect adjusts itself in clear, orderly, proportionate form; which form, after a very little time, becomes classical in its turn.

The romantic or classical character of a picture, a poem, a literary work, depends, then, on the balance of certain qualities in it; and in this sense, a very real distinction may be drawn between good classical and good romantic work. But all critical terms are relative; and there is at least a valuable suggestion in that theory of Stendhal's, that all good art was romantic in its day. In the beauties of Homer and Pheidias, quiet as they now seem, there must have been, for those who confronted them for the first time, excitement and surprise, the sudden, unforeseen satisfaction of the desire of beauty. Yet the *Odyssey*, with its marvellous adventure, is more romantic than the *Iliad*, which nevertheless contains, among many other romantic episodes, that of the immortal horses of Achilles, who weep at the death of Patroclus.[40] Æschylus is more romantic than Sophocles, whose *Philoctetes*, were it written now, might figure, for the strangeness of its motive and the perfectness of its execution, as typically romantic; while, of Euripides, it may be said, that his method in writing his plays is to sacrifice readily almost everything else, so that he may attain the fulness of a single romantic effect.

37. *Cf.* Stendhal *Racine et Shakespeare*, in his *Œuvres*, ed. 1925, XVIII,45.

38. See *Inferno*, Canto XXXIII. This episode, as well as others, is romantic, with its vividly exciting account of imprisonment, starvation, and gory revenge.

39. See Browning, 'Fra Lippo Lippi,' l. 233.

40. *Iliad*, XVII,424–55.

These two tendencies, indeed, might be applied as a measure or standard, all through Greek and Roman art and poetry, with very illuminating results; and for an analyst of the romantic principle in art, no exercise would be more profitable, than to walk through the collection of classical antiquities at the Louvre, or the British Museum, or to examine some representative collection of Greek coins, and note how the element of curiosity, of the love of strangeness, insinuates itself into classical design, and record the effects of the romantic spirit there, the traces of struggle, of the grotesque even, though overbalanced here by sweetness; as in the sculpture of Chartres and Rheims, the real sweetness of mind in the sculptor is often overbalanced by the grotesque, by the rudeness of his strength.

Classicism, then, means for Stendhal, for that younger enthusiastic band of French writers whose unconscious method he formulated into principles, the reign of what is pedantic, conventional, and narrowly academical in art; for him, all good art is romantic. To Sainte-Beuve, who understands the term in a more liberal sense, it is the characteristic of certain epochs, of certain spirits in every epoch, not given to the exercise of original imagination, but rather to the working out of refinements of manner on some authorised matter; and who bring to their perfection, in this way, the elements of sanity, of order and beauty in manner. In general criticism, again, it means the spirit of Greece and Rome, of some phases in literature and art that may seem of equal authority with Greece and Rome, the age of Louis the Fourteenth, the age of Johnson;[41] though this is at best an uncritical use of the term, because in Greek and Roman work there are typical examples of the romantic spirit. But explain the terms as we may, in application to particular epochs, there are these two elements always recognisable; united in perfect art — in Sophocles, in Dante, in the highest work of Goethe, though not always absolutely balanced there; and these two elements may be not inappropriately termed the classical and romantic tendencies.

Material for the artist, motives of inspiration, are not yet exhausted: our curious, complex, aspiring age still abounds in subjects for æsthetic manipulation by the literary as well as by other forms of art. For the literary art, at all events, the problem just now is, to induce order upon the contorted, proportionless accumulation of our knowledge and experience, our science and history, our hopes and disillusion, and, in effecting this, to do consciously what has been done hitherto for the most part too unconsciously, to write our English language as the Latins wrote theirs, as the French write, as scholars should write. Appealing, as he may, to precedent in this matter, the scholar will still remember that if 'the style is the man'[42] it is also the age: that the nineteenth century too will be found to have had its style, justified by necessity — a style very different, alike from the baldness of an impossible 'Queen Anne' revival, and an incorrect, incondite exuberance, after the mode of Elizabeth: that we can only return to either at the price of an impoverishment of form or matter, or both, although, an intellectually rich age such as ours being necessarily an eclectic one, we may well cultivate some of the excellences of literary types so different as those: that in literature as in other matters it is well to unite as many diverse elements as may be: that the individual writer or artist, certainly, is to be estimated by the number of graces he combines, and his power of interpenetrating them in a given work. To discriminate schools, of art, of literature, is, of course, part of the obvious business of literary criticism: but, in the work of literary production, it is easy to be overmuch occupied concerning them. For, in truth, the

41. Louis XIV, king of France, 1643–1715; Dr. Samuel Johnson (1709–84).

42. See Pater's 'Style,' note 32.

legitimate contention is, not of one age or school of literary art against another, but of all successive schools alike, against the stupidity which is dead to the substance, and the vulgarity which is dead to form.

MISCELLANEOUS STUDIES

The Child in the House

As Florian Deleal walked, one hot afternoon, he overtook by the wayside a poor aged man, and, as he seemed weary with the road, helped him on with the burden which he carried, a certain distance. And as the man told his story, it chanced that he named the place, a little place in the neighbourhood of a great city, where Florian had passed his earliest years, but which he had never since seen, and, the story told, went forward on his journey comforted. And that night, like a reward for his pity, a dream of that place came to Florian, a dream which did for him the office of the finer sort of memory, bringing its object to mind with a great clearness, yet, as sometimes happens in dreams, raised a little above itself, and above ordinary retrospect. The true aspect of the place, especially of the house there in which he had lived as a child, the fashion of its doors, its hearths, its windows, the very scent upon the air of it, was with him in sleep for a season; only, with tints more musically blent on wall and floor, and some finer light and shadow running in and out along its curves and angles, and with all its little carvings daintier. He awoke with a sigh at the thought of almost thirty years which lay between him and that place, yet with a flutter of pleasure still within him at the fair light, as if it were a smile, upon it. And it happened that this accident of his dream was just the thing needed for the beginning of a certain design he then had in view, the noting, namely, of some things in the story of his spirit — in that process of brain-building by which we are, each one of us, what we are. With the image of the place so clear and favourable upon him, he fell to thinking of himself therein, and how his thoughts had grown up to him. In that half-spiritualised house he could watch the better, over again, the gradual expansion of the soul which had come to be there — of which, indeed, through the law which makes the material objects about them so large an element in children's lives, it had actually become a part; inward and outward being woven through and through each other into one inextricable texture — half, tint and trace and accident of homely colour and form, from the wood and the bricks; half, mere soul-stuff, floated thither from who knows how far. In the house and garden of his dream he saw a child moving, and could divide the main streams at least of the winds that had played on him, and study so the first stage in that mental journey.

The *old house*, as when Florian talked of it afterwards he always called it (as all children do, who can recollect a change of home, soon enough but not too soon to mark a period in their lives), really was an old house; and an element of French descent in its inmates — descent from Watteau,[1] the old court-painter, one of whose gallant pieces still hung in one of the rooms — might explain, together with some other things, a noticeable trimness and comely whiteness about everything there — the curtains, the couches, the paint on the walls with which the light and shadow played so delicately; might explain also the tolerance of the great poplar in the garden, a tree most often despised by English people, but which French people love, having observed a certain fresh way its leaves have of dealing with the wind, making it sound, in never

1. Jean Antoine Watteau (1684–1721), French painter.

so slight a stirring of the air, like running water.

The old-fashioned, low wainscoting went round the rooms, and up the staircase with carved balusters and shadowy angles, landing half-way up at a broad window, with a swallow's nest below the sill, and the blossom of an old pear-tree showing across it in late April, against the blue, below which the perfumed juice of the find of fallen fruit in autumn was so fresh. At the next turning came the closet which held on its deep shelves the best china. Little angel faces and reedy flutings stood out round the fireplace of the children's room. And on the top of the house, above the large attic, where the white mice ran in the twilight — an infinite, unexplored wonderland of childish treasures, glass beads, empty scent-bottles still sweet, thrum of coloured silks, among its lumber [2] — a flat space of roof, railed round, gave a view of the neighbouring steeples; for the house, as I said, stood near a great city, which sent up heavenwards, over the twisting weather-vanes, not seldom, its beds of rolling cloud and smoke, touched with storm or sunshine. But the child of whom I am writing did not hate the fog because of the crimson lights which fell from it sometimes upon the chimneys, and the whites which gleamed through its openings, on summer mornings, on turret or pavement. For it is false to suppose that a child's sense of beauty is dependent on any choiceness or special fineness in the objects which present themselves to it, though this indeed comes to be the rule with most of us in later life; earlier, in some degree, we see inwardly; and the child finds for itself, and with unstinted delight, a difference for the sense, in those whites and reds through the smoke on very homely buildings, and in the gold of the dandelions at the roadside, just beyond the houses, where not a handful of earth is virgin and untouched, in the lack of better ministries to its desire of beauty.

This house then stood not far beyond the gloom and rumours of the town, among high garden-walls, bright all summer-time with golden-rod and brown-and-golden wall-flower — *flos parietis*, as the children's Latin-reading father taught them to call it, while he was with them. Tracing back the threads of his complex spiritual habit, as he was used in after years to do, Florian found that he owed to the place many tones of sentiment afterwards customary with him, certain inward lights under which things most naturally presented themselves to him. The coming and going of travellers to the town along the way, the shadow of the streets, the sudden breath of the neighbouring gardens, the singular brightness of bright weather there, its singular darknesses which linked themselves in his mind to certain engraved illustrations in the old big Bible at home, the coolness of the dark, cavernous shops round the great church, with its giddy winding stair up to the pigeons and the bells — a citadel of peace in the heart of the trouble — all this acted on his childish fancy, so that ever afterwards the like aspects and incidents never failed to throw him into a well-recognised imaginative mood, seeming actually to have become a part of the texture of his mind. Also, Florian could trace home to this point a pervading preference in himself for a kind of comeliness and dignity, an *urbanity* [3] literally, in modes of life, which he connected with the pale people of towns, and which made him susceptible to a kind of exquisite satisfaction in the trimness and well-considered grace of certain things and persons he afterwards met with, here and there, in his way through the world.

So the child of whom I am writing lived on there quietly; things without ministering to him, as he sat daily at the window with the bird-cage hanging below it, and

2. *Thrum*: tufts, fringes. *Lumber*: old household stuff.

3. Manner of life characteristic of cities.

his mother taught him to read, wondering at the ease with which he learned, and at the quickness of his memory. The perfume of the little flowers of the lime-tree fell through the air upon them like rain; while time seemed to move ever more slowly to the murmur of the bees in it, till it almost stood still on June afternoons. How insignificant, at the moment, seem the influences of the sensible things which are tossed and fall and lie about us, so, or so, in the environment of early childhood. How indelibly, as we afterwards discover, they affect us; with what capricious attractions and associations they figure themselves on the white paper, the smooth wax, of our ingenuous souls, as 'with lead in the rock for ever,'[4] giving form and feature, and as it were assigned house-room in our memory, to early experiences of feeling and thought, which abide with us ever afterwards, thus, and not otherwise. The realities and passions, the rumours of the greater world without, steal in upon us, each by its own special little passage-way, through the wall of custom about us; and never afterwards quite detach themselves from this or that accident, or trick, in the mode of their first entrance to us. Our susceptibilities, the discovery of our powers, manifold experiences — our various experiences of the coming and going of bodily pain, for instance — belong to this or the other well-remembered place in the material habitation — that little white room with the window across which the heavy blossoms could beat so peevishly in the wind, with just that particular catch or throb, such a sense of teasing in it, on gusty mornings; and the early habitation thus gradually becomes a sort of material shrine or sanctuary of sentiment; a system of visible symbolism interweaves itself through all our thoughts and passions; and irresistibly, little shapes, voices, accidents — the angle at which the sun in the morning fell on the pillow — become parts of the great chain wherewith we are bound.

Thus far, for Florian, what all this had determined was a peculiarly strong sense of home — so forcible a motive with all of us — prompting to us our customary love of the earth, and the larger part of our fear of death, that revulsion we have from it, as from something strange, untried, unfriendly; though life-long imprisonment, they tell you, and final banishment from home is a thing bitterer still; the looking forward to but a short space, a mere childish *goûter*[5] and dessert of it, before the end, being so great a resource of effort to pilgrims and wayfarers, and the soldier in distant quarters, and lending, in lack of that, some power of solace to the thought of sleep in the home churchyard, at least — dead cheek by dead cheek, and with the rain soaking in upon one from above.

So powerful is this instinct, and yet accidents like those I have been speaking of so mechanically determine it; its essence being indeed the early familiar, as constituting our ideal, or typical conception, of rest and security. Out of so many possible conditions, just this for you and that for me, brings ever the unmistakable realisation of the delightful *chez soi*;[6] this for the Englishman, for me and you, with the closely drawn white curtain and the shaded lamp; that, quite other, for the wandering Arab, who folds his tent every morning, and makes his sleeping-place among haunted ruins or in old tombs.

With Florian then the sense of home became singularly intense, his good fortune being that the special character of his home was in itself so essentially homelike. As after many wanderings I have come to fancy that some parts of Surrey and Kent are, for Englishmen, the true landscape, true home-counties, by right, partly, of a

4. *Job*, xix,23–24: 'Oh that my words were now written! oh that they were printed in a book! That they were graven with an iron pen and lead in the rock for ever.'

5. 'lunch.'

6. 'at home.'

certain earthy warmth in the yellow of the sand below their gorse-bushes, and of a certain grey-blue mist after rain, in the hollows of the hills there, welcome to fatigued eyes, and never seen farther south; so I think that the sort of house I have described, with precisely those proportions of red-brick and green, and with a just perceptible monotony in the subdued order of it, for its distinguishing note, is for Englishmen at least typically home-like. And so for Florian that general human instinct was reinforced by this special home-likeness in the place his wandering soul had happened to light on, as, in the second degree, its body and earthly tabernacle; the sense of harmony between his soul and its physical environment became, for a time at least, like perfectly played music, and the life led there singularly tranquil and filled with a curious sense of self-possession. The love of security, of an habitually undisputed standing-ground or sleeping-place, came to count for much in the generation and correcting of his thoughts, and afterwards as a salutary principle of restraint in all his wanderings of spirit. The wistful yearning towards home, in absence from it, as the shadows of evening deepened, and he followed in thought what was doing there from hour to hour, interpreted to him much of a yearning and regret he experienced afterwards, towards he knew not what, out of strange ways of feeling and thought in which, from time to time, his spirit found itself alone; and in the tears shed in such absences there seemed always to be some soul-subduing foretaste of what his last tears might be.

And the sense of security could hardly have been deeper, the quiet of the child's soul being one with the quiet of its home, a place 'inclosed' and 'sealed.' But upon this assured place, upon the child's assured soul which resembled it, there came floating in from the larger world without, as at windows left ajar unknowingly, or over the high garden walls, two streams of impressions, the sentiments of beauty and pain — recognitions of the visible, tangible, audible loveliness of things, as a very real and somewhat tyrannous element in them — and of the sorrow of the world, of grown people and children and animals, as a thing not to be put by in them. From this point he could trace two predominant processes of mental change in him — the growth of an almost diseased sensibility to the spectacle of suffering, and, parallel with this, the rapid growth of a certain capacity of fascination by bright colour and choice form — the sweet curvings, for instance, of the lips of those who seemed to him comely persons, modulated in such delicate unison to the things they said or sang, — marking early the activity in him of a more than customary sensuousness, 'the lust of the eye,' as the Preacher says,[7] which might lead him, one day, how far! Could he have foreseen the weariness of the way! In music sometimes the two sorts of impressions came together, and he would weep, to the surprise of older people. Tears of joy too the child knew, also to older people's surprise; real tears, once, of relief from long-strung, childish expectation, when he found returned at evening, with new roses in her cheeks, the little sister who had been to a place where there was a wood, and brought back for him a treasure of fallen acorns, and black crow's feathers, and his peace at finding her again near him mingled all night with some intimate sense of the distant forest, the rumour of its breezes, with the glossy blackbirds aslant and the branches lifted in them, and of the perfect nicety of the little cups that fell. So those two elementary apprehensions of the tenderness and of the colour in things grew apace in him, and were seen by him afterwards to send their roots back into the beginnings of life.

Let me note first some of the occasions of his recognition of the element of pain in things — incidents, now and again,

7. *Cf. I John*, ii,16.

which seemed suddenly to awake in him the whole force of that sentiment which Goethe has called the *Weltschmerz*,[8] and in which the concentrated sorrow of the world seemed suddenly to lie heavy upon him. A book lay in an old book-case, of which he cared to remember one picture — a woman sitting, with hands bound behind her, the dress, the cap, the hair, folded with a simplicity which touched him strangely, as if not by her own hands, but with some ambiguous care at the hands of others — Queen Marie Antoinette, on her way to execution — we all remember David's[9] drawing, meant merely to make her ridiculous. The face that had been so high had learned to be mute and resistless; but out of its very resistlessness seemed now to call on men to have pity, and forbear; and he took note of that, as he closed the book, as a thing to look at again, if he should at any time find himself tempted to be cruel. Again, he would never quite forget the appeal in the small sister's face, in the garden under the lilacs, terrified at a spider lighted on her sleeve. He could trace back to the look then noted a certain mercy he conceived always for people in fear, even of little things, which seemed to make him, though but for a moment, capable of almost any sacrifice of himself. Impressible, susceptible persons, indeed, who had had their sorrows, lived about him; and this sensibility was due in part to the tacit influence of their presence, enforcing upon him habitually the fact that there are those who pass their days, as a matter of course, in a sort of 'going quietly.' Most poignantly of all he could recall, in unfading minutest circumstance, the cry on the stair, sounding bitterly through the house, and struck into his soul for ever, of an aged woman, his father's sister, come now to announce his death in distant India; how it seemed to make the aged woman like a child again; and, he knew not why, but this fancy was full of pity to him. There were the little sorrows of the dumb animals too — of the white angora, with a dark tail like an ermine's, and a face like a flower, who fell into a lingering sickness, and became quite delicately human in its valetudinarianism, and came to have a hundred different expressions of voice — how it grew worse and worse, till it began to feel the light too much for it, and at last, after one wild morning of pain, the little soul flickered away from the body, quite worn to death already, and now but feebly retaining it.

So he wanted another pet; and as there were starlings about the place, which could be taught to speak, one of them was caught, and he meant to treat it kindly; but in the night its young ones could be heard crying after it, and the responsive cry of the mother-bird towards them; and at last, with the first light, though not till after some debate with himself, he went down and opened the cage, and saw a sharp bound of the prisoner up to her nestlings; and therewith came the sense of remorse, — that he too was become an accomplice in moving, to the limit of his small power, the springs and handles of that great machine in things, constructed so ingeniously to play pain-fugues on the delicate nerve-work of living creatures.

I have remarked how, in the process of our brain-building, as the house of thought in which we live gets itself together, like some airy bird's-nest of floating thistle-down and chance straws, compact at last, little accidents have their consequence; and thus it happened that, as he walked one evening, a garden gate, usually closed, stood open; and lo! within, a great red hawthorn in full flower, embossing heavily the bleached and twisted trunk and branches, so aged that there were but few green leaves thereon — a plumage of tender, crimson fire out of the heart of the dry wood. The perfume of the tree had now and again reached him, in

8. 'World sorrow; sentimental pessimism.'

9. Jacques Louis David (1748–1825), French painter.

the currents of the wind, over the wall, and he had wondered what might be behind it, and was now allowed to fill his arms with the flowers — flowers enough for all the old blue-china pots along the chimney-piece, making *fête* in the children's room. Was it some periodic moment in the expansion of soul within him, or mere trick of heat in the heavily laden summer air? But the beauty of the thing struck home to him feverishly; and in dreams at night he loitered along a magic roadway of crimson flowers, which seemed to open ruddily in thick, fresh masses about his feet, and fill softly all the little hollows in the banks on either side. Always afterwards, summer by summer, as the flowers came on, the blossom of the red hawthorn still seemed to him absolutely the reddest of all things; and the goodly crimson, still alive in the works of old Venetian masters or old Flemish tapestries, called out always from afar the recollection of the flame in those perishing little petals, as it pulsed gradually out of them, kept long in the drawers of an old cabinet. Also then, for the first time, he seemed to experience a passionateness in his relation to fair outward objects, an inexplicable excitement in their presence, which disturbed him, and from which he half longed to be free. A touch of regret or desire mingled all night with the remembered presence of the red flowers, and their perfume in the darkness about him: and the longing for some undivined, entire possession of them was the beginning of a revelation to him, growing ever clearer, with the coming of the gracious summer guise of fields and trees and persons in each succeeding year, of a certain, at times seemingly exclusive, predominance in his interests, of beautiful physical things, a kind of tyranny of the senses over him.

In later years he came upon philosophies which occupied him much in the estimate of the proportion of the sensuous and the ideal elements in human knowledge, the relative parts they bear in it; and, in his intellectual scheme, was led to assign very little to the abstract thought, and much to its sensible vehicle or occasion. Such metaphysical speculation did but reinforce what was instinctive in his way of receiving the world, and for him, everywhere, that sensible vehicle or occasion became, perhaps only too surely, the necessary concomitant of any perception of things, real enough to be of any weight or reckoning, in his house of thought. There were times when he could think of the necessity he was under of associating all thoughts to touch and sight, as a sympathetic link between himself and actual, feeling, living objects; a protest in favour of real men and women against mere grey, unreal abstractions; and he remembered gratefully how the Christian religion, hardly less than the religion of the ancient Greeks, translating so much of its spiritual verity into things that may be seen, condescends in part to sanction this infirmity, if so it be, of our human existence, wherein the world of sense is so much with us, and welcomed this thought as a kind of keeper and sentinel over his soul therein. But certainly he came more and more to be unable to care for or think of soul but as in an actual body, or of any world but that wherein are water and trees, and where men and women look so or so, and press actual hands. It was the trick even his pity learned, fastening those who suffered in any wise to his affections by a kind of sensible attachments. He would think of Julian, fallen into incurable sickness, as spoiled in the sweet blossom of his skin like pale amber, and his honey-like hair; of Cecil, early dead, as cut off from the lilies, from golden summer days, from women's voices; and then what comforted him a little was the thought of the turning of the child's flesh to violets in the turf above him. And thinking of the very poor, it was not the things which most men care most for that he yearned to give them; but fairer roses, perhaps, and power to taste quite as they will, at

their ease and not task-burdened, a certain desirable clear light in the new morning, through which sometimes he had noticed them, quite unconscious of it, on their way to their early toil.

So he yielded himself to these things, to be played upon by them like a musical instrument, and began to note with deepening watchfulness, but always with some puzzled, unutterable longing in his enjoyment, the phases of the seasons and of the growing or waning day, down even to the shadowy changes wrought on bare wall or ceiling — the light cast up from the snow, bringing out their darkest angles; the brown light in the cloud, which meant rain; that almost too austere clearness, in the protracted light of the lengthening day, before warm weather began, as if it lingered but to make a severer workday, with the school-books opened earlier and later; that beam of June sunshine, at last, as he lay awake before the time, a way of gold-dust across the darkness; all the humming, the freshness, the perfume of the garden seemed to lie upon it — and coming in one afternoon in September, along the red gravel walk, to look for a basket of yellow crab-apples left in the cool, old parlour, he remembered it the more, and how the colours struck upon him, because a wasp on one bitten apple stung him, and he felt the passion of sudden, severe pain. For this too brought its curious reflections; and, in relief from it, he would wonder over it — how it had then been with him — puzzled at the depth of the charm or spell over him, which lay, for a little while at least, in the mere absence of pain; once, especially, when an older boy taught him to make flowers of sealing-wax, and he had burnt his hand badly at the lighted taper, and been unable to sleep. He remembered that also afterwards, as a sort of typical thing — a white vision of heat about him, clinging closely, through the languid scent of the ointments put upon the place to make it well.

Also, as he felt this pressure upon him of the sensible world, then, as often afterwards, there would come another sort of curious questioning how the last impressions of eye and ear might happen to him, how they would find him — the scent of the last flower, the soft yellowness of the last morning, the last recognition of some object of affection, hand or voice; it could not be but that the latest look of the eyes, before their final closing, would be strangely vivid; one would go with the hot tears, the cry, the touch of the wistful bystander, impressed how deeply on one! or would it be, perhaps, a mere frail retiring of all things, great or little, away from one, into a level distance?

For with this desire of physical beauty mingled itself early the fear of death — the fear of death intensified by the desire of beauty. Hitherto he had never gazed upon dead faces, as sometimes, afterwards, at the Morgue in Paris, or in that fair cemetery at Munich, where all the dead must go and lie in state before burial, behind glass windows, among the flowers and incense and holy candles — the aged clergy with their sacred ornaments, the young men in their dancing-shoes and spotless white linen — after which visits, those waxen, resistless faces would always live with him for many days, making the broadest sunshine sickly. The child had heard indeed of the death of his father, and how, in the Indian station, a fever had taken him, so that though not in action he had yet died as a soldier; and hearing of the 'resurrection of the just,'[10] he could think of him as still abroad in the world, somehow, for his protection — a grand though perhaps rather terrible figure, in beautiful soldier's things, like the figure in the picture of Joshua's Vision[11] in the Bible — and of that round which the mourners moved so softly, and afterwards with such solemn singing, as but a worn-out garment left at a deserted lodging. So it was, until on a summer day he walked

10. *Cf. Luke*, xiv,14.
11. See *Joshua*, v,13–15.

with his mother through a fair churchyard. In a bright dress he rambled among the graves, in the gay weather, and so came, in one corner, upon an open grave for a child — a dark space on the brilliant grass — the black mould heaped up round it, weighing down the little jeweled branches of the dwarf rosebushes in flower. And therewith came, full-grown, never wholly to leave him, with the certainty that even children do sometimes die, the physical horror of death, with its wholly selfish recoil from the association of lower forms of life, and the suffocating weight above. No benign, grave figure in beautiful soldier's things any longer abroad in the world for his protection! only a few poor, piteous bones; and above them, possibly, a certain sort of figure he hoped not to see. For sitting one day in the garden below an open window, he heard people talking, and could not but listen, how, in a sleepless hour, a sick woman had seen one of the dead sitting beside her, come to call her hence; and from the broken talk evolved with much clearness the notion that not all those dead people had really departed to the churchyard, nor were quite so motionless as they looked, but led a secret, half-fugitive life in their old homes, quite free by night, though sometimes visible in the day, dodging from room to room, with no great goodwill towards those who shared the place with them. All night the figure sat beside him in the reveries of his broken sleep, and was not quite gone in the morning — an odd, irreconcilable new member of the household, making the sweet familiar chambers unfriendly and suspect by its uncertain presence. He could have hated the dead he had pitied so, for being thus. Afterwards he came to think of those poor, home-returning ghosts, which all men have fancied to themselves — the *revenants*[12] — pathetically, as crying, or beating with vain hands at the doors, as the wind came, their cries distinguishable in it as a wilder inner note. But, always making death more unfamiliar still, that old experience would ever, from time to time, return to him; even in the living he sometimes caught its likeness; at any time or place, in a moment, the faint atmosphere of the chamber of death would be breathed around him, and the image with the bound chin, the quaint smile, the straight stiff feet, shed itself across the air upon the bright carpet, amid the gayest company, or happiest communing with himself.

To most children the sombre questionings to which impressions like these attach themselves, if they come at all, are actually suggested by religious books, which therefore they often regard with much secret distaste, and dismiss, as far as possible, from their habitual thoughts as a too depressing element in life. To Florian such impressions, these misgivings as to the ultimate tendency of the years, of the relationship between life and death, had been suggested spontaneously in the natural course of his mental growth by a strong innate sense for the soberer tones in things, further strengthened by actual circumstances; and religious sentiment, that system of biblical ideas in which he had been brought up, presented itself to him as a thing that might soften and dignify, and light up as with a 'lively hope,'[13] a melancholy already deeply settled in him. So he yielded himself easily to religious impressions, and with a kind of mystical appetite for sacred things, the more as they came to him through a saintly person who loved him tenderly, and believed that this early preoccupation with them already marked the child out for a saint. He began to love, for their own sakes, church lights, holy days, all that belonged to the comely order of the sanctuary, the secrets of its white linen, and holy vessels, and fonts of pure water; and its hieratic purity and simplicity became the type of something he desired to

12. 'returners,' as from the dead.

have about him in actual life. He pored over the pictures in religious books, and knew by heart the exact mode in which the wrestling angel grasped Jacob,[14] how Jacob looked in his mysterious sleep,[15] how the bells and pomegranates were attached to the hem of Aaron's vestment, sounding sweetly as he glided over the turf of the holy place.[16] His way of conceiving religion came then to be in effect what it ever afterwards remained — a sacred history indeed, but still more a sacred ideal, a transcendent version or representation, under intense and more expressive light and shade, of human life and its familiar or exceptional incidents, birth, death, marriage, youth, age, tears, joy, rest, sleep, waking — a mirror, towards which men might turn away their eyes from vanity and dullness, and see themselves therein as angels, with their daily meat and drink, even, become a kind of sacred transaction — a complementary strain or burden,[17] applied to our every-day existence, whereby the stray snatches of music in it re-set themselves, and fall into the scheme of some higher and more consistent harmony. A place adumbrated itself in his thoughts, wherein those sacred personalities, which are at once the reflex and the pattern of our nobler phases of life, housed themselves; and this region in his intellectual scheme all subsequent experience did but tend still further to realise and define. Some ideal, hieratic persons he would always need to occupy it and keep a warmth there. And he could hardly understand those who felt no such need at all, finding themselves quite happy without such heavenly companionship, and sacred double of their life, beside them.

Thus a constant substitution of the typical for the actual took place in his thoughts. Angels might be met by the way, under English elm or beech-tree; mere messengers seemed like angels, bound on celestial errands; a deep mysticity brooded over real meetings and partings; marriages were made in heaven; and deaths also, with hands of angels thereupon, to bear soul and body quietly asunder, each to its appointed rest. All the acts and accidents of daily life borrowed a sacred colour and significance; the very colours of things became themselves weighty with meanings like the sacred stuffs of Moses' tabernacle, full of penitence or peace.[18] Sentiment, congruous in the first instance only with those divine transactions, the deep, effusive unction of the House of Bethany,[19] was assumed as the due attitude for the reception of our every-day existence; and for a time he walked through the world in a sustained, not unpleasurable awe, generated by the habitual recognition, beside every circumstance and event of life, of its celestial correspondent.

Sensibility — the desire of physical beauty — a strange biblical awe, which made any reference to the unseen act on him like solemn music — these qualities the child took away with him, when, at about the age of twelve years, he left the old house, and was taken to live in another place. He had never left his home before, and, anticipating much from this change, had long dreamed over it, jealously counting the days till the time fixed for departure should come; had been a little careless about others even, in his strong desire for it — when Lewis fell sick, for instance, and they must wait still two days longer. At last the morning came, very fine; and all things — the very pavement with its dust, at the roadside — seemed to have a white, pearl-like lustre in them. They were to travel by a favourite road on which he had often walked a certain distance, and on one of those two prisoner days, when Lewis was sick, had walked farther than ever before, in his great desire to reach the new place. They

had started and gone a little way when a pet bird was found to have been left behind, and must even now — so it presented itself to him — have already all the appealing fierceness and wild self-pity at heart of one left by others to perish of hunger in a closed house; and he returned to fetch it, himself in hardly less stormy distress. But as he passed in search of it from room to room, lying so pale, with a look of meekness in their denudation, and at last through that little stripped white room, the aspect of the place touched him like the face of one dead; and a clinging back towards it came over him, so intense that he knew it would last long, and spoiling all his pleasure in the realisation of a thing so eagerly anticipated. And so, with the bird found, but himself in an agony of homesickness, thus capriciously sprung up within him, he was driven quickly away, far into the rural distance, so fondly speculated on, of that favourite country road.

GREEK STUDIES

Hippolytus Veiled

A STUDY FROM EURIPIDES [1]

CENTURIES of zealous archæology notwithstanding, many phases of the so varied Greek genius are recorded for the modern student in a kind of shorthand only, or not at all. Even for Pausanias,[2] visiting Greece before its direct part in affairs was quite played out, much had perished or grown dim — of its art, of the truth of its outward history, above all of its religion as a credible or practicable thing. And yet Pausanias visits Greece under conditions as favourable for observation as those under which later travellers, Addison or Eustace,[3] proceed to Italy. For him the impress of life in those old Greek cities is not less vivid and entire than that of medieval Italy to ourselves; at Siena,[4] for instance, with its ancient palaces still in occupation, its public edifices as serviceable as if the old republic had but just now vacated them, the tradition of their primitive worship still unbroken in its churches. Had the opportunities in which Pausanias was fortunate been ours, how many haunts of the antique Greek life unnoticed by him we should have peeped into, minutely systematic in our painstaking! how many a view would broaden out where he notes hardly anything at all on his map of Greece!

One of the most curious phases of Greek civilisation which has thus perished for us, and regarding which, as we may fancy, we should have made better use of that old traveller's facilities, is the early Attic deme-life [5] — its picturesque, intensely localised variety, in the hollow or on the spur of mountain or sea-shore; and with it many a relic of primitive religion, many an early growth of art parallel to what Vasari records of artistic beginnings in the smaller cities of Italy. Colonus and Acharnæ, surviving still so vividly by the magic of Sophocles, of Aristophanes, are but isolated examples of a widespread manner of life, in which, amid many provincial peculiarities, the first, yet perhaps the most costly and telling steps were made in all the various departments of Greek culture. Even in the days of Pausanias, Piræus was still traceable as a distinct township, once

3. Joseph Addison's *Remarks on Italy* appeared in 1705. John C. Eustace (1765?–1815), English writer and Roman Catholic priest, published his *Tour through Italy* in 1813.
4. A town in northern Italy.
5. About 508 B.C., Attica was divided into one hundred demes (townships or administrative units).

the possible rival of Athens, with its little old covered market by the seaside, and the symbolical picture of the place, its Genius, visible on the wall. And that is but the type of what there had been to know of threescore and more village communities, each having its own altars, its special worship and place of civic assembly, its trade and crafts, its name drawn from physical peculiarity or famous incident, its body of heroic tradition. Lingering on while Athens, the great deme, gradually absorbed into itself more and more of their achievements, and passing away almost completely as political factors in the Peloponnesian war,[6] they were still felt, we can hardly doubt, in the actual physiognomy of Greece. That variety in unity, which its singular geographical formation secured to Greece as a whole, was at its utmost in these minute reflexions of the national character, with all the relish of local difference — new art, new poetry, fresh ventures in political combination, in the conception of life, springing as if straight from the soil, like the thorn-blossom of early spring in magic lines over all that rocky land. On the other hand, it was just here that ancient habits clung most tenaciously — that old-fashioned, homely, delightful existence, to which the refugee, pent up in Athens in the years of the Peloponnesian war, looked back so fondly. If the impression of Greece generally is but enhanced by the littleness of the physical scene of events intellectually so great — such a system of grand lines, restrained within so narrow a compass, as in one of its fine coins — still more would this be true of those centres of country life. Here, certainly, was that assertion of seemingly small interests, which brings into free play, and gives his utmost value to, the individual; making his warfare, equally with his more peaceful rivalries, deme against deme, the mountain against the plain, the sea-shore, (as in our own old Border[7] life, but played out here by wonderfully gifted people) tangible as a personal history, to the doubling of its fascination for those whose business is with the survey of the dramatic side of life.

As with civil matters, so it was also, we may fairly suppose, with religion; the deme-life was a manifestation of religious custom and sentiment, in all their primitive local variety. As Athens, gradually drawing into itself the various elements of provincial culture, developed, with authority, the central religious position, the demes-men did but add the worship of Athene Polias, the goddess of the capital, to their own pre-existent ritual uses. Of local and central religion alike, time and circumstance had obliterated much when Pausanias came. A devout spirit, with religion for his chief interest, eager for the trace of a divine footstep, anxious even in the days of Lucian[8] to deal seriously with what had counted for so much to serious men, he has, indeed, to lament that 'Pan is dead': — 'They come no longer!' — 'These things happen no longer!' But the Greek — his very name also, *Hellen*, was the title of a priesthood — had been religious abundantly, sanctifying every detail of his actual life with the religious idea; and as Pausanias goes on his way he finds many a remnant of that earlier estate of religion, when, as he fancied, it had been nearer the gods, as it was certainly nearer the earth. It is marked, even in decay, with varieties of place; and is not only continuous but *in situ*.[9] At Phigaleia he makes his offerings to Demeter, agreeably to the paternal rites of the inhabitants, wax, fruit, undressed

6. The Peloponnesus, or southern peninsula of Greece, was the main seat of the Dorian Greeks, notably the Spartans. The Peloponnesian War, 431–404 B.C., was fought by Athens and her allies against Sparta and her allies.

wool 'still full of the *sordes* of the sheep.'[10] A dream from heaven cuts short his notice of the mysteries of Eleusis. He sees the stone, 'big enough for a little man,' on which Silenus was used to sit and rest;[11] at Athens, the tombs of the Amazons, of the purple-haired Nisus, of Deucalion; — 'it is a manifest token that he had dwelt there.'[12] The worshippers of Poseidon, even at his temple among the hills, might still feel the earth fluctuating beneath their feet. And in care for divine things, he tells us, the Athenians outdid all other Greeks.[13] Even in the days of Nero it revealed itself oddly; and it is natural to suppose that of this temper the demes, as the proper home of conservatism, were exceptionally expressive. Scattered in those remote, romantic villages, among their olives or sea-weeds, lay the heroic graves, the relics, the sacred images, often rude enough amid the delicate tribute of later art; this too oftentimes finding in such retirement its best inspirations, as in some Attic Fiesole.[14] Like a network over the land of gracious poetic tradition, as also of undisturbed ceremonial usage surviving late for those who cared to seek it, the local religions had been never wholly superseded by the worship of the great national temples. They were, in truth, the most characteristic developments of a faith essentially earth-born or indigenous.

And how often must the student of fine art, again, wish he had the same sort of knowledge about its earlier growth in Greece, that he actually possesses in the case of Italian art! Given any development at all in this matter, there must have been phases of art, which, if immature, were also veritable expressions of power to come, intermediate discoveries of beauty, such as are by no means a mere anticipation, and of service only as explaining historically larger subsequent achievements, but of permanent attractiveness in themselves, being often, indeed, the true maturity of certain amiable artistic qualities. And in regard to Greek art at its best — the Parthenon — no less than to the art of the Renaissance at its best — the Sistine Chapel — the more instructive light would be derived rather from what precedes than what follows such central success, from the determination to apprehend the fulfilment of past effort rather than the eve of decline, in the critical, central moment which partakes of both. Of such early promise, early achievement, we have in the case of Greek art little to compare with what is extant of the youth of the arts in Italy. Overbeck's[15] careful gleanings of its history form indeed a sorry relic as contrasted with Vasari's intimations of the beginnings of the Renaissance. Fired by certain fragments of its earlier days, of a beauty, in truth, absolute, and vainly longing for more, the student of Greek sculpture indulges the thought of an ideal of youthful energy therein, yet withal of youthful self-restraint; and again, as with survivals of old religion, the privileged home, he fancies, of that ideal

must have been in those venerable Attic townships, as to a large extent it passed away with them.

The budding of new art, the survival of old religion, at isolated centres of provincial life, where varieties of human character also were keen, abundant, asserted in correspondingly effective incident — this is what irresistible fancy superinduces on historic details, themselves meagre enough. The sentiment of antiquity is indeed a characteristic of all cultivated people, even in what may seem the freshest ages, and not exclusively a humour of our later world. In the earliest notices about them, as we know, the people of Attica appear already impressed by the immense antiquity of their occupation of its soil, of which they claim to be the very first flower. Some at least of those old demes-men we may well fancy sentimentally reluctant to change their habits, fearful of losing too much of themselves in the larger stream of life, clinging to what is antiquated as the work of centralisation goes on, needful as that work was, with the great 'Eastern difficulty' already ever in the distance. The fear of Asia, barbaric, splendid, hardly known, yet haunting the curious imagination of those who had borrowed thence the art in which they were rapidly excelling it, developing, as we now see, in the interest of Greek humanity, crafts begotten of tyrannic and illiberal luxury, was finally to suppress the rivalries of those primitive centres of activity, when the 'invincible armada' of the common foe came into sight.[16]

At a later period civil strife was to destroy their last traces. The old hoplite,[17] from Rhamnus or Acharnæ, pent up in beleaguered Athens during that first summer of the Peloponnesian war, occupying with his household a turret of the wall, as Thucydides describes — one of many picturesque touches in that severe historian — could well remember the ancient provincial life which this conflict with Sparta was bringing to an end. He could recall his boyish, half-scared curiosity concerning those Persian ships, coming first as merchantmen, or with pirates on occasion, in the half-savage, wicked splendours of their decoration, the monstrous figure-heads, their glittering freightage. Men would hardly have trusted their women or children with that suspicious crew, hovering through the dusk. There were soothsayers, indeed, who had long foretold what happened soon after, giving shape to vague, supernatural terrors. And then he had crept from his hiding-place with other lads to go view the enemies' slain at Marathon,[18] beside those belated Spartans, this new war with whom seemed to be reviving the fierce local feuds of his younger days. *Paraloi* and *Diacrioi* had ever been rivals.[19] Very distant it all seemed now, with all the stories he could tell; for in those crumbling little towns, as heroic life had lingered on into the actual, so, at an earlier date, the supernatural into the heroic. Like mist at dawn, the last traces of its divine visitors had then vanished from the land, where, however, they had already begotten 'our best and oldest families.'

It was Theseus,[20] uncompromising young master of the situation, in fearless application of 'the modern spirit' of his day to every phase of life where it was applicable, who, at the expense of Attica, had given Athens a people, reluctant

18. A pass in the mountains north of Athens, where the invading Persians were defeated in 490 B.C.

19. *Paraloi*: the people of the seacoast. *Diacrioi*: the mountaineers. These are the names of two of the three political parties in Athens. *Cf.* Aristotle, *Constitution of Athens*, XIII,4.

20. In Greek mythology, the heroic son of Aegeus, king of Athens. Plutarch's *Lives* includes a brief life of him.

enough, in truth, as Plutarch suggests, to desert 'their homes and religious usages and many good and gracious kings of their own' for this elect youth, who thus figures, passably, as a kind of mythic shorthand for civilisation, making roads and the like, facilitating travel, suppressing various forms of violence, but many innocent things as well. So it must needs be in a world where, even hand in hand with a god-assisted hero, Justice goes blindfold. He slays the bull of Marathon and many another local tyrant, but also exterminates that delightful creature, the Centaur. The Amazon, whom Plato will reinstate as the type of improved womanhood, has no better luck than Phæa, the sow-pig of Crommyon, foul old landed-proprietress.[21] They exerted, however, the prerogative of poetic protest, and survive thereby. Centaur and Amazon, as we see them in the fine art of Greece, represent the regret of Athenians themselves for something that could never be brought to life again, and have their pathos. Those young heroes contending with Amazons on the frieze of the Mausoleum[22] had best make haste with their bloody work, if young people's eyes can tell a true story. A type still of progress triumphant through injustice, set on improving things off the face of the earth, Theseus took occasion to attack the Amazons in their mountain home, not long after their ruinous conflict with Hercules,[23] and hit them when they were down. That greater bully had laboured off on the world's highway, carrying with him the official girdle of Antiope, their queen, gift of Ares, and therewith, it would seem, the mystic secret of their strength. At sight of this new foe, at any rate, she came to a strange submission. The savage virgin had turned to very woman, and was presently a willing slave, returning on the gaily appointed ship in all haste to Athens, where in supposed wedlock she bore King Theseus a son.

With their annual visit — visit to the Gargareans[1] — for the purpose of maintaining their species, parting with their boys early, these husbandless women could hardly be supposed a very happy, certainly not a very joyous people. They figure rather as a sorry measure of the luck of the female sex in taking a hard natural law into their own hands, and by abnegation of all tender companionship making shift with bare independence, as a kind of second-best — the best practicable by them in the imperfect actual condition of things. But the heart strings would ache still where the breast had been cut away. The sisters of Antiope had come, not immediately, but in careful array of battle, to bring back the captive. All along the weary roads from the Caucasus to Attica, their traces had remained in the great graves of those who died by the way. Against the little remnant, carrying on the fight to the very midst of Athens, Antiope herself had turned, all other thoughts transformed now into wild idolatry of her hero. Superstitious, or in real regret, the Athenians never forgot their tombs. As for Antiope, the conscience of her perfidy remained with her, adding the pang of remorse to her own desertion, when King Theseus, with his accustomed bad faith to women, set her, too, aside in turn. Phædra, the true wife, was there, peeping suspiciously at her arrival; and even as Antiope yielded to her lord's embraces the thought had come that a male child might

21. 'About this time Crommyon was infested by a wild sow named Phaea, a fierce and formidable creature.' Theseus slew her 'But some say, that Phaea was an abandoned female robber, who dwelt in Crommyon, that she had the name of Sow from her life and manners.' (Plutarch's *Lives*, 'Theseus.') A centaur was half man, half horse.

22. Magnificent tomb of King Mausolus, of Caria, in Greek Asia Minor, erected about 350 B.C.

23. One of the twelve labors of Hercules was his securing the girdle of the queen of the Amazons. Ares (*cf.* the next sentence), the Greek god of war, the Roman Mars. Mt. Gargarus (*cf.* 'the Gargareans' in the next paragraph), in Asia Minor, is at a considerable distance from the Caucasus.

be the instrument of her anger, and one day judge her cause.

In one of these doomed, decaying villages, then, King Theseus placed the woman and her babe, hidden, yet secure, within the Attic border, as men veil their mistakes or crimes. They might pass away, they and their story, together with the memory of other antiquated creatures of such places, who had had connubial dealings with the stars. The white, paved waggon-track, a by-path of the sacred way to Eleusis, zigzagged through sloping olive-yards, from the plain of silvered blue, with Athens building in the distance, and passed the door of the rude stone house, furnished scantily, which no one had ventured to inhabit of late years till they came there. On the ledges of the grey cliffs above, the laurel groves, stem and foliage of motionless bronze, had spread their tents. Travellers bound northwards were glad to repose themselves there, and take directions, or provision for their journey onwards, from the highland people, who came down hither to sell their honey, their cheese, and woollen stuff, in the tiny market-place. At dawn the great stars seemed to halt a while, burning as if for sacrifice to some pure deity, on those distant, obscurely named heights, like broken swords, the rim of the world. A little later you could just see the newly opened quarries, like streaks of snow on their russet-brown bosoms. Thither in spring-time all eyes turned from Athens devoutly, intent till the first shaft of lightning gave signal for the departure of the sacred ship to Delos.[24] Racing over those rocky surfaces, the virgin air descended hither with the secret of profound sleep, as the child lay in its cubicle hewn in the stone, the white fleeces heaped warmly round him. In the wild Amazon's soul, to her surprise, and at first against her will, the maternal sense had quickened from the moment of his conception, and (that burst of angry tears with which she had received him into the world once dried up), kindling more eagerly at every token of manly growth, had at length driven out every other feeling. And this animal sentiment, educating the human hand and heart in her, had become a moral one, when, King Theseus leaving her in anger, visibly unkind, the child had crept to her side, and tracing with small fingers the wrinkled lines of her woebegone brow, carved there as if by a thousand years of sorrow, had sown between himself and her the seed of an undying sympathy.

She was thus already on the watch for a host of minute recognitions on his part, of the self-sacrifice involved in her devotion to a career of which she must needs drain out the sorrow, careful that he might taste only the joy. So far, amid their spare living, the child, as if looking up to the warm broad wing of her love above him, seemed replete with comfort. Yet in his moments of childish sickness, the first passing shadows upon the deep joy of her motherhood, she teaches him betimes to soothe or cheat pain — little bodily pains only, hitherto. She ventures sadly to assure him of the harsh necessities of life: 'Courage, child! Every one must take his share of suffering. Shift not thy body so vehemently. Pain, taken quietly, is easier to bear.'

Carefully inverting the habits of her own rude childhood, she learned to spin the wools, white and grey, to clothe and cover him pleasantly. The spectacle of his unsuspicious happiness, though at present a matter of purely physical conditions, awoke a strange sense of poetry, a kind of artistic sense in her, watching, as her own long-deferred recreation in life, his delight in the little delicacies she prepared to his liking — broiled kids' flesh, the red wine, the mushrooms sought through the early dew — his hunger and thirst so daintily

24. Island sacred to Apollo, where Latona, also called Leto, bore to Zeus the twins Apollo and Diana. Other names for Diana (goddess of the moon, the hunt, virginity, health, and childbirth) were Artemis, Cynthia, Hecate.

satisfied, as he sat at table, like the first-born of King Theseus, with two wax-lights and a fire at dawn or nightfall dancing to the prattle and laughter, a bright child, never stupidly weary. At times his very happiness would seem to her like a menace of misfortune to come. Was there not with herself the curse of that unsisterly action? and not far from him, the terrible danger of the father's, the step-mother's jealousy, the mockery of those half-brothers to come? Ah! how perilous for happiness the sensibilities which make him so exquisitely happy now! Before they started on their dreadful visit to the Minotaur,[25] says Plutarch, the women told their sons many tales and other things to encourage them; and, even as she had furnished the child betimes with rules for the solace of bodily pain, so now she would have brought her own sad experience into service in precepts for the ejection of its festering power out of any other trouble that might visit him. Already those little disappointments which are as the shadow beside all conscious enjoyment, were no petty things to her, but had for her their pathos, as children's troubles will have, in spite of the longer chance before them. They were as the first steps in a long story of deferred hopes, or anticipations of death itself and the end of them.

The gift of Ares gone, the mystic girdle she would fain have transferred to the child, that bloody god of storm and battle, hereditary patron of her house, faded from her thoughts together with the memory of her past life — the more completely, because another familiar though somewhat forbidding deity, accepting certainly a cruel and forbidding worship, was already in possession, and reigning in the new home when she came thither. Only, thanks to some kindly local influence (by grace, say, of its delicate air), Artemis, this other god[26] she had known in the Scythian wilds, had put aside her fierce ways, as she paused awhile on her heavenly course among these ancient abodes of men, gliding softly, mainly through their dreams, with abundance of salutary touches. Full, in truth, of grateful memory of some timely service at human hands! In these highland villages the tradition of celestial visitants clung fondly, of god or hero, belated or misled on long journeys, yet pleased to be among the sons of men, as their way led them up the steep, narrow, crooked street, condescending to rest a little, as one, under some sudden stress not clearly ascertained, had done here, in this very house, thereafter for ever sacred. The place and its inhabitants, of course, had been something bigger in the days of those old mythic hospitalities, unless, indeed, divine persons took kindly the will for the deed — very different, surely, from the present condition of things, for there was little here to detain a delicate traveller, even in the abode of Antiope and her son, though it had been the residence of a king.

Hard by stood the chapel of the goddess, who had thus adorned the place with her memories. The priests, indeed, were already departed to Athens, carrying with them the ancient image, the vehicle of her actual presence, as the surest means of enriching the capital at the expense of the country, where she must now make poor shift of the occasional worshipper on his way through these mountain passes. But safely roofed beneath the sturdy tiles of grey Hymettus marble,[27] upon the walls of the little square recess enclosing the deserted pedestal, a series of crowded imageries, in the devout spirit of earlier days, were eloquent concerning her. Here from scene to scene, touched with silver among the wild and human creatures in dun bronze, with the moon's disk around her

25. A monster in Crete with a bull's body and a human head. Minos, king of Crete, forced the Athenians to send yearly tribute of human sacrifices — seven youths and seven maidens — for the Minotaur to devour. Finally Theseus slew the monster.

26. That is, this other sort of Artemis.

27. From Mt. Hymettus, in Attica.

head, shrouded closely, the goddess of the chase still glided mystically through all the varied incidents of her story, in all the detail of a written book.

A book for the delighted reading of a scholar, willing to ponder at leisure, to make his way surely, and understand. Very different, certainly, from the cruel-featured little idol his mother had brought in her bundle — the old Scythian Artemis, hanging there on the wall, side by side with the forgotten Ares, blood-red, — the goddess reveals herself to the lad, poring through the dusk by taper-light, as at once a virgin, necessarily therefore the creature of solitude, yet also as the assiduous nurse of children, and patroness of the young. Her friendly intervention at the act of birth everywhere, her claim upon the nursling, among tame and wild creatures equally, among men as among gods, nay! among the stars (upon the very star of dawn), gave her a breadth of influence seemingly coextensive with the sum of things. Yes! his great mother was in touch with everything. Yet throughout he can but note her perpetual chastity, with pleasurable though half-suspicious wonder at the mystery, he knows not what, involved therein, as though he awoke suddenly in some distant, unexplored region of her person and activity. Why the lighted torch always, and that long straight vesture rolled round so formally? Was it only against the cold of these northern heights?

To her, nevertheless, her maternity, her solitude, to this virgin mother, who, with no husband, no lover, no fruit of her own, is so tender to the children of others, in a full heart he devotes himself — his immaculate body and soul. Dedicating himself thus, he has the sense also that he becomes more entirely than ever the chevalier of his mortal mother, of her sad cause. The devout, diligent hands clear away carefully the dust, the faded relics of her former worship; a worship renewed once more as the sacred spring, set free from encumbrance, in answer to his willing ministries murmurs again under the dim vault in its marble basin, work of primitive Titanic fingers — flows out through its rocky channel, filling the whole township with chaste thoughts of her.

Through much labour at length he comes to the veritable story of her birth, like a gift direct from the goddess herself to this loyal soul. There were those in later times who, like Æschylus, knew Artemis as the daughter not of Leto but of Demeter, according to the version of her history now conveyed to the young Hippolytus,[28] together with some deepened insight into her character. The goddess of Eleusis, on a journey, in the old days when, as Plato says, men lived nearer the gods, finding herself with child by some starry inmate of those high places, had lain down in the rock-hewn cubicle of the inner chamber, and, certainly in sorrow, brought forth a daughter. Here was the secret at once of the genial, all-embracing maternity of this new strange Artemis, and of those more dubious tokens, the lighted torch, the winding-sheet, the arrow of death on the string — of sudden death, truly, which may be thought after all the kindest, as prevenient of all disgraceful sickness or waste in the unsullied limbs. For the late birth into the world of this so shadowy daughter was somehow identified with the sudden passing into Hades of her first-born, Persephone.[29] As

28. The son borne to Theseus by Antiope. A version of the history of Demeter is given by Pausanias (see *Description of Greece*, VIII,xlii) as follows. Poseidon had an amour with Demeter, who gave birth not to a foal, but to her whom the Arcadians call Despoena. And after this, they say, partly from indignation with Poseidon, partly from sorrow at the theft of Persephone, she dressed in black and went to this cave in Phigalia and stayed there long. Later she was persuaded to lay aside her anger and grief.

29. The Roman Proserpina. She was seized by Dis (Pluto), and carried off to become his queen in Hades, the underworld to which went the

he scans those scenes anew, an awful surmise comes to him; his divine patroness moves there as death, surely. Still, however, gratefully putting away suspicion, he seized even in these ambiguous imageries their happier suggestions, satisfied in thinking of his new mother as but the giver of sound sleep, of the benign night, whence — mystery of mysteries! — good things are born softly, from which he awakes betimes for his healthful service to her. Either way, sister of Apollo or sister of Persephone, to him she should be a power of sanity, sweet as the flowers he offered her gathered at dawn, setting daily their purple and white frost against her ancient marbles. There was more certainly than the first breath of day in them. Was there here something of her person, her sensible presence, by way of direct response to him in his early devotion, astir for her sake before the very birds, nesting here so freely, the quail above all, in some privileged connexion with her story still unfathomed by the learned youth? Amid them he too found a voice, and sang articulately the praises of the great goddess.

Those more dubious traits, nevertheless, so lightly disposed of by Hippolytus (Hecate [30] thus counting for him as Artemis goddess of health), became to his mother, in the light of her sad experience, the sum of the whole matter. While he drew only peaceful inducements to sleep from that two-sided figure, she reads there a volume of sinister intentions, and liked little this seemingly dead goddess, who could but move among the living banefully, stealing with her night-shade into the day where she had no proper right. The gods had ever had much to do with the shaping of her fortunes and the fortunes of her kindred; and the mortal mother felt nothing less than jealousy from the hour when the lad had first delightedly called her to share his discoveries, and learn the true story (if it were not rather the malicious counterfeit) of the new divine mother to whom he has thus absolutely entrusted himself. Was not this absolute chastity itself a kind of death? She, too, in secret makes her gruesome midnight offering with averted eyes. She dreams one night he is in danger; creeps to his cubicle to see; the face is covered, as he lies, against the cold. She traces the motionless outline, raises the coverlet; with the nice black head deep in the fleecy pillow he is sleeping quietly, he dreams of that other mother gliding in upon the moonbeam, and awaking turns sympathetically upon the living woman, is subdued in a moment to the expression of her troubled spirit, and understands.

And when the child departed from her for the first time, springing from his white bed before the dawn, to accompany the elders on their annual visit to the Eleusinian goddess, the after sense of his wonderful happiness, tranquillising her in spite of herself by its genial power over the actual moment, stirred nevertheless a new sort of anxiety for the future. Her work in life henceforward was defined as a ministry to so precious a gift, in full consciousness of its risk; it became her religion, the centre of her pieties. She missed painfully his continual singing hovering about the place, like the earth itself made audible in all its humanities. Half-selfish for a moment, she prays that he may remain for ever a child, to her solace; welcomes now the promise of his chastity (though chastity were itself a kind of death) as the pledge of his abiding always with her. And these thoughts were but infixed more deeply by the sudden stroke of joy at his return home in ceremonial trim and grown more manly, with much increase of self-confidence in that brief absence among his fellows.

For, from the first, the unwelcome child, the outcast, had been successful, with that

spirits of the dead. Pater pictures Hippolytus as conceiving of merging the two daughters of Demeter, and considering Artemis as possibly one and the same goddess as Persephone.

30. Goddess, queen of the dark underworld; identified here with Persephone.

special good fortune which sometimes attends the outcast. His happiness, his invincible happiness, had been found engaging, perhaps by the gods, certainly by men; and when King Theseus came to take note how things went in that rough life he had assigned them, he felt a half liking for the boy, and bade him come down to Athens and see the sights, partly by way of proof to his already somewhat exacting wife of the difference between the old love and the new as measured by the present condition of their respective offspring. The fine nature, fastidious by instinct, but bred with frugality enough to find the charm of continual surprise in that delicate new Athens, draws, as he goes, the full savour of its novelties; the marbles, the space and finish, the busy gaiety of its streets, the elegance of life there, contrasting with while it adds some mysterious endearment to the thought of his own rude home. Without envy, in hope only one day to share, to win them by kindness, he gazes on the motley garden-plots, the soft bedding, the showy toys, the delicate keep of the children of Phædra, who turn curiously to their half-brother, venture to touch his long strange gown of homespun grey, like the soft coat of some wild creature who might let one stroke it. Close to their dainty existence for a while, he regards it as from afar; looks forward all day to the lights, the prattle, the laughter, the white bread, like sweet cake to him, of their ordinary evening meal; returns again and again, in spite of himself, to watch, to admire, feeling a power within him to merit the like; finds his way back at last, still light of heart, to his own poor fare, able to do without what he would enjoy so much. As, grateful for his scanty part in things — for the make-believe of a feast in the little white loaves she too has managed to come by, sipping the thin white wine, he touches her dearly, the mother is shocked with a sense of something unearthly in his contentment, while he comes and goes, singing now more abundantly than ever a new canticle to her divine rival. Were things, after all, to go grudgingly with him? Sensible of that curse on herself, with her suspicions of his kinsfolk, of this dubious goddess to whom he has devoted himself, she anticipates with more foreboding than ever his path to be, with or without a wife — her own solitude, or his — the painful heats and cold. She fears even these late successes; it were best to veil their heads. The strong as such had ever been against her and hers. The father came again; noted the boy's growth. Manliest of men, like Hercules in his cloak of lion's skin, he has after all but scant liking, feels, through a certain meanness of soul, scorn for the finer likeness of himself. Might this creature of an already vanishing world, who for all his hard rearing had a manifest distinction of character, one day become his rival, full of loyalty as he was already to the deserted mother?

To charming Athens, nevertheless, he crept back, as occasion served, to gaze peacefully on the delightful good fortune of others, waiting for the opportunity to take his own turn with the rest, driving down thither at last in a chariot gallantly, when all the town was assembled to celebrate the king's birthday. For the goddess, herself turning ever kinder, and figuring more and more exclusively as the tender nurse of all things, had transformed her young votary from a hunter into a charioteer, a rearer and driver of horses, after the fashion of his Amazon mothers before him. Thereupon, all the lad's wholesome vanity had centred on the fancy of the world-famous games then lately established, as, smiling down his mother's terrors, and grateful to his celestial mother for many a hair-breadth escape, he practised day by day, fed the animals, drove them out, amused though companionless, visited them affectionately in the deserted stone stables of the ancient king. A chariot and horses, as being the showiest outward thing the world afforded, was like the

pawn he moved to represent the big demand he meant to make, honestly, generously, on the ample fortunes of life. There was something of his old miraculous kindred, alien from this busy new world he came to, about the boyish driver with the fame of a scholar, in his grey fleecy cloak and hood of soft white woollen stuff, as he drove in that morning. Men seemed to have seen a star flashing, and crowded round to examine the little mountain-bred beasts, in loud, friendly intercourse with the hero of the hour — even those usually somewhat unsympathetic half-brothers now full of enthusiasm for the outcast and his good fight for prosperity. Instinctively people admired his wonderful placidity, and would fain have shared its secret, as it were the carelessness of some fair flower upon his face. A victor in the day's race, he carried home as his prize a glittering new harness in place of the very old one he had come with. 'My chariot and horses!' he says now, with his single touch of pride. Yet at home, savouring to the full his old solitary happiness, veiled again from time to time in that ancient life, he is still the student, still ponders the old writings which tell of his divine patroness. At Athens strange stories are told in turn of him, his nights upon the mountains, his dreamy sin, with that hypocritical virgin goddess, stories which set the jealous suspicions of Theseus at rest once more. For so 'dream' not those who have the tangible, appraisable world in view. Even Queen Phædra looks with pleasure, as he comes, on the once despised illegitimate creature, at home now here too, singing always audaciously, so visibly happy, occupied, popular.

Encompassed by the luxuries of Athens, far from those peaceful mountain places, among people further still in spirit from their peaceful light and shade, he did not forget the kindly goddess, still sharing with his earthly mother the prizes, or what they would buy, for the adornment of their spare abode. The tombs of the fallen Amazons, the spot where they had breathed their last, he piously visited, informed himself of every circumstance of the event with devout care, and, thinking on them amid the dainties of the royal table, boldly brought them too their share of the offerings to the heroic dead. Aphrodite,[31] indeed — Aphrodite, of whom he had scarcely so much as heard — was just then the best-served deity in Athens, with all its new wealth of colour and form, its gold and ivory, the acting, the music, the fantastic women, beneath the shadow of the great walls still rising steadily. Hippolytus would have no part in her worship; instead did what was in him to revive the neglected service of his own goddess, stirring an old jealousy. For Aphrodite too had looked with delight upon the youth, already the centre of a hundred less dangerous human rivalries among the maidens of Greece, and was by no means indifferent to his indifference, his instinctive distaste; while the sterner, almost forgotten Artemis found once more her great moon-shaped cake, set about with starry tapers, at the appointed seasons.

They know him now from afar, by his emphatic, shooting, arrowy movements; and on the day of the great chariot races 'he goes in and wins.' To the surprise of all he compounded his handsome prize for the old wooden image taken from the chapel at home, lurking now in an obscure shrine in the meanest quarter of the town. Sober amid the noisy feasting which followed, unashamed, but travelling by night to hide it from their mockery, warm at his bosom, he reached the passes at twilight, and through the deep peace of the glens bore it to the old resting-place, now more worthy than ever of the presence of its mistress, his mother and all the people of the village coming forth to salute her, all doors set mystically open, as she advances.

Phædra too, his step-mother, a fiery soul with wild strange blood in her veins, forgetting her fears of this illegitimate rival

31. The Roman Venus.

of her children, seemed now to have seen him for the first time, loved at last the very touch of his fleecy cloak, and would fain have had him of her own religion. As though the once neglected child had been another, she tries to win him as a stranger in his manly perfection, growing more than an affectionate mother to her husband's son. But why thus intimate and congenial, she asks, always in the wrong quarter? Why not compass two ends at once? Why so squeamishly neglect the powerful, any power at all, in a city so full of religion? He might find the image of her sprightly goddess [32] everywhere, to his liking, gold, silver, native or stranger, new or old, graceful, or indeed, if he preferred it so, in iron or stone. By the way, she explains the delights of love, of marriage, the husband once out of the way; finds in him, with misgiving, a sort of forwardness, as she thinks, on this one matter, as if he understood her craft and despised it. He met her questions in truth with scarce so much as contempt, with laughing counter-queries, why people needed wedding at all? They might have *found* the children in the temples, or bought them, as you could buy flowers in Athens.

Meantime Phædra's young children draw from the seemingly unconscious finger the marriage-ring, set it spinning on the floor at his feet, and the staid youth places it for a moment on his own finger for safety. As it settles there, his step-mother, aware all the while, suddenly presses his hand over it. He found the ring there that night as he lay; left his bed in the darkness, and again, for safety, put it on the finger of the image, wedding once for all that so kindly mystical mother. And still, even amid his earthly mother's terrible misgivings, he seems to foresee a charming career marked out before him in friendly Athens, to the height of his desire. Grateful that he is here at all, sharing at last so freely life's banquet, he puts himself for a moment in his old place, recalling his old enjoyment of the pleasure of others; feels, just then, no different. Yet never had life seemed so sufficing as at this moment — the meat, the drink, the drives, the popularity as he comes and goes, even his step-mother's false, selfish, ostentatious gifts. But she, too, begins to feel something of the jealousy of that other divine, would-be mistress, and by way of a last effort to bring him to a better mind in regard to them both, conducts him (immeasurable privilege!) to her own private chapel.

You could hardly tell where the apartments of the adulteress ended and that of the divine courtesan began. Haunts of her long, indolent, self-pleasing nights and days, they presented everywhere the impress of Phædra's luxurious humour. A peculiar glow, such as he had never before seen, like heady lamplight, or sunshine to some sleeper in a delirious dream, hung upon, clung to, the bold, naked, shameful imageries, as his step-mother trimmed the lamps, drew forth her sickly perfumes, clad afresh in piquant change of raiment the almost formless goddess crouching there in her unclean shrine or stye, set at last her foolish wheel in motion to a low chant, holding him by the wrist, keeping close all the while, as if to catch some germ of consent in his indifferent words.

And little by little he perceives that all this is for him — the incense, the dizzy wheel, the shreds of stuff cut secretly from his sleeve, the sweetened cup he drank at her offer, unavailingly; and yes! his own features surely, in pallid wax. With a gasp of flighty laughter she ventures to point the thing out to him, full as he is at last of visible, irrepressible dislike. Ah! it was that very reluctance that chiefly stirred her. Healthily white and red, he had a marvellous air of discretion about him, as of one never to be caught unaware, as if he never could be anything but like water from the rock, or the wild flowers of the

32. That is, Aphrodite. In the second paragraph below she is called ' the divine courtesan.'

morning, or the beams of the morning star turned to human flesh. It was the self-possession of this happy mind, the purity of this virgin body, she would fain have perturbed, as a pledge to herself of her own gaudy claim to supremacy. King Theseus, as she knew, had had at least two earlier loves; for once she would be a first love; felt at moments that with this one passion once indulged, it might be happiness thereafter to remain chaste for ever. And then, by accident, yet surely reading indifference in his manner of accepting her gifts, she is ready again for contemptuous, open battle. Is he indeed but a child still, this nursling of the forbidding Amazon, of that Amazonian goddess — to be a child always? or a wily priest rather, skilfully circumventing her sorceries, with mystic precautions of his own? In truth, there is something of the priestly character in this impassible discretion, reminding her of his alleged intimacy with the rival goddess, and redoubling her curiosity, her fondness. Phædra, love-sick, feverish, in bodily sickness at last, raves of the cool woods, the chase, the steeds of Hippolytus, her thoughts running madly on what she fancies to be his secret business; with a storm of abject tears, foreseeing in one moment of recoil the weary tale of years to come, star-stricken as she declares, she dared at last to confess her longing to already half-suspicious attendants; and, awake one morning to find Hippolytus there kindly at her bidding, drove him openly forth in a tempest of insulting speech. There was a mordant there, like the menace of misfortune to come, in which the injured goddess also was invited to concur. What words! what terrible words! following, clinging to him, like acrid fire upon his bare flesh, as he hasted from Phædra's house, thrust out at last, his vesture remaining in her hands. The husband returning suddenly, she tells him a false story of violence to her bed, and is believed.

King Theseus, all his accumulated store of suspicion and dislike turning now to active hatred, flung away readily upon him, bewildered, unheard, one of three precious curses (some mystery of wasting sickness therein) with which Poseidon had indulged him.[33] It seemed sad that one so young must call for justice, precariously, upon the gods, the dead, the very walls! Admiring youth dared hardly bid farewell to their late comrade; are generous, at most, in stolen, sympathetic glances towards the fallen star. At home, veiled once again in that ancient twilight world, his mother, fearing solely for what he may suffer by the departure of that so brief prosperity, enlarged as it had been, even so, by his grateful taking of it, is reassured, delighted, happy once more at the visible proof of his happiness, his invincible happiness. Duly he returned to Athens, early astir, for the last time, to restore the forfeited gifts, drove back his gaily painted chariot to leave there behind him, actually enjoying the drive, going home on foot poorer than ever. He takes again to his former modes of life, a little less to the horses, a little more to the old studies, the strange, secret history of his favourite goddess, — wronged surely! somehow, she too, as powerless to help him; till he lay sick at last, battling one morning, unaware of his mother's presence, with the feverish creations of the brain; the giddy, foolish wheel, the foolish song, of Phædra's chapel, spinning there with his heart bound thereto. 'The curses of my progenitors are come upon me!' he cries. 'And yet, why so? guiltless as I am of evil.' His wholesome religion seeming to turn against him now, the trees, the streams, the very rocks, swoon into living creatures, swarming around the goddess who has lost her grave quietness. He finds solicitation, and recoils, in the wind, in the sounds of the rain; till at length delirium itself finds a note of returning

33. Theseus had been promised by Poseidon that any three curses that he wished to utter would be put into effect.

health. The feverish wood-ways of his fancy open unexpectedly upon wide currents of air, lulling him to sleep; and the conflict ending suddenly altogether at its sharpest, he lay in the early light motionless among the pillows, his mother standing by, as she thought, to see him die. As if for the last time, she presses on him the things he had liked best in that eating and drinking she had found so beautiful. The eyes, the eyelids are big with sorrow; and, as he understands again, making an effort for her sake, the healthy light returns into his; a hand seizes hers gratefully, and a slow convalescence begins, the happiest period in the wild mother's life. When he longed for flowers for the goddess, she went a toilsome journey to seek them, growing close, after long neglect, wholesome and firm on their tall stalks. The singing she had longed for so despairingly hovers gaily once more within the chapel and around the house.

At the crisis of that strange illness she had supposed her long forebodings about to be realised at last; but upon his recovery feared no more, assured herself that the curses of the father, the step-mother, the concurrent ill-will of that angry goddess, have done their utmost; he will outlive her; a few years hence put her to a rest surely welcome. Her misgivings, arising always out of the actual spectacle of his profound happiness, seemed at an end in this meek bliss, the more as she observed that it was a shade less unconscious than of old. And almost suddenly he found the strength, the heart, in him, to try his fortune again with the old chariot; and those still unsatisfied curses, in truth, going on either side of him like living creatures unseen, legend tells briefly how, a competitor for pity with Adonis, and Icarus, and Hyacinth,[34] and other doomed creatures of immature radiance in all story to come, he set forth joyously for the chariot-races, not of Athens, but of Trœzen, her rival. Once more he wins the prize; he says good-bye to admiring friends anxious to entertain him, and by night starts off homewards, as of old, like a child, returning quickly through the solitude in which he had never lacked company, and was now to die. Through all the perils of darkness he had guided the chariot safely along the curved shore; the dawn was come, and a little breeze astir, as the grey level spaces parted delicately into white and blue, when in a moment an earthquake, or Poseidon the earth-shaker himself, or angry Aphrodite awake from the deep betimes, rent the tranquil surface; a great wave leapt suddenly into the placid distance of the Attic shore, and was surging here to the very necks of the plunging horses, a moment since enjoying so pleasantly with him the caress of the morning air, but now, wholly forgetful of their old affectionate habit of obedience, dragging their leader headlong over the rough pavements. Evening and the dawn might seem to have met on that hapless day through which they drew him home entangled in the trappings of the chariot that had been his ruin, till he lay at length, grey and haggard, at the rest he had longed for dimly amid the buffeting of those murderous stones, his mother watching impassibly, sunk at once into the condition she had so long anticipated.

Later legend breaks a supernatural light over that great desolation, and would fain relieve the reader by introducing the kindly Asclepius,[35] who presently restores the youth to life, not, however, in the old

34. Adonis, a youth beloved by Aphrodite and warned by her, was slain by a wild boar which he insisted on hunting. Icarus and his father escaped from Crete by artificial wings; but young Icarus flew too near the sun, in spite of warning, the wax of his wings melted, and he was drowned. Hyacinth, a youth beloved of Apollo; once when he and the god were competing with the discus and Apollo had thrown it far, he rushed out to seize it and make his throw, but it bounded up and struck him fatally on the forehead.

35. God of medicine and healing.

form or under familiar conditions. To her, surely, counting the wounds, the disfigurements, telling over the pains which had shot through that dear head now insensible to her touch among the pillows under the harsh broad daylight, that would have been no more of a solace than if, according to the fancy of Ovid,[36] he flourished still, a little deity, but under a new name and veiled now in old age, in the haunted grove of Aricia,[37] far from his old Attic home, in a land which had never seen him as he was.

36. See Ovid's *Metamorphoses*, XV.470–546.

37. Aricia, a wooded valley in Italy, where, according to Ovid, Hippolytus now is called Virbius, and lives as a follower of Diana (Artemis).

Robert Louis Stevenson
1850–1894

VIRGINIBUS PUERISQUE

Æs Triplex [1]

THE changes wrought by death are in themselves so sharp and final, and so terrible and melancholy in their consequences, that the thing stands alone in man's experience and has no parallel upon earth. It outdoes all other accidents because it is the last of them. Sometimes it leaps suddenly upon its victims, like a Thug; [2] sometimes it lays a regular siege, and creeps upon their citadel during a score of years. And when the business is done, there is sore havoc made in other people's lives, and a pin knocked out by which many subsidiary friendships hung together. There are empty chairs, solitary walks, and single beds at night. Again, in taking away our friends, death does not take them away utterly, but leaves behind a mocking, tragical, and soon intolerable residue, which must be hurriedly concealed. Hence a whole chapter of sights and customs striking to the mind, from the pyramids of Egypt to the gibbets and dule trees [3] of mediæval Europe. The poorest persons have a bit of pageant going towards the tomb; memorial stones are set up over the least memorable; and, in order to preserve some show of respect for what remains of our old loves and friendships, we must accompany it with much grimly ludicrous ceremonial, and the hired undertaker parades before the door. All this, and much more of the same sort, accompanied by the eloquence of poets, has gone a great way to put humanity in error; nay, in many philosophies the error has been embodied and laid down with every circumstance of logic; although in real life the bustle and swiftness, in leaving people little time to think, have not left them time enough to go dangerously wrong in practice.

As a matter of fact, although few things are spoken of with more fearful whisperings than this prospect of death, few have less influence on conduct under healthy circumstances. We have all heard of cities of South America built upon the side of fiery mountains, and how, even in this tremendous neighbourhood, the inhabitants are not a jot more impressed

1. 'Triple brass,' or, figuratively, 'great courage.' *Cf.* Stevenson's translation in the sentence with note 17, below. The phrase is part of Horace, *Odes*, I,iii,9–12: 'Heart of oak and triple brass lay round the breast of him who first to the savage sea entrusted his frail bark.' (Trans. Lonsdale and Lee.)

2. In northern India, before 1830–40, existed a fraternity whose members, called Thugs, made murder their profession.

3. Gallows and mourning trees. In Scotland a clan would gather under a dule tree to mourn for its dead.

by the solemnity of mortal conditions than if they were delving gardens in the greenest corner of England. There are serenades and suppers, and much gallantry among the myrtles overhead; and meanwhile the foundation shudders underfoot, the bowels of the mountain growl, and at any moment living ruin may leap sky-high into the moonlight, and tumble man and his merry-making in the dust. In the eyes of very young people, and very dull old ones, there is something indescribably reckless and desperate in such a picture. It seems not credible that respectable married people, with umbrellas, should find appetite for a bit of supper within quite a long distance of a fiery mountain; ordinary life begins to smell of high-handed debauch when it is carried on so close to a catastrophe; and even cheese and salad, it seems, could hardly be relished in such circumstances without something like a defiance of the Creator. It should be a place for nobody but hermits dwelling in prayer and maceration, or mere born-devils drowning care in a perpetual carouse.

And yet, when one comes to think upon it calmly, the situation of these South American citizens forms only a very pale figure for the state of ordinary mankind. This world itself, travelling blindly and swiftly in overcrowded space, among a million other worlds travelling blindly and swiftly in contrary directions, may very well come by a knock that would set it into explosion like a penny squib.[4] And what, pathologically looked at, is the human body, with all its organs, but a mere bagful of petards? The least of these is as dangerous to the whole economy as the ship's powder-magazine to the ship; and with every breath we breathe, and every meal we eat, we are putting one or more of them in peril. If we clung as devotedly as some philosophers pretend we do to the abstract idea of life, or were half as frightened as they make out we are for the subversive accident that ends it all, the trumpets might sound by the hour and no one would follow them into battle — the blue-peter[5] might fly at the truck, but who would climb into a sea-going ship? Think (if these philosophers were right) with what a preparation of spirit we should affront the daily peril of the dinner-table — a deadlier spot than any battle-field in history, where the far greater proportion of our ancestors have miserably left their bones! What woman would ever be lured into marriage, so much more dangerous than the wildest sea? And what would it be to grow old? For, after a certain distance, every step we take in life we find the ice growing thinner below our feet, and all around us and behind us we see our contemporaries going through. By the time a man gets well into the seventies, his continued existence is a mere miracle; and when he lays his old bones in bed for the night, there is an overwhelming probability that he will never see the day. Do the old men mind it, as a matter of fact? Why, no. They were never merrier; they have their grog at night, and tell the raciest stories; they hear of the death of people about their own age, or even younger, not as if it was a grisly warning, but with a simple childlike pleasure at having outlived some one else; and when a draught might puff them out like a guttering candle, or a bit of a stumble shatter them like so much glass, their old hearts keep sound and unaffrighted, and they go on, bubbling with laughter, through years of man's age compared to which the valley at Balaklava[6] was as safe and peaceful as a village cricket-green on Sunday. It may fairly be questioned (if we look to the peril only) whether it was a much more daring feat

4. *Squib*: a pipe, tube, or ball of paper filled with powder; also called a petard.

5. A blue flag with a white square in the center, used to show that the ship is ready to sail. *Truck*: small wooden cap at the top of a mast.

6. Site of the 'valley of death' (*cf.* Tennyson's 'Charge of the Light Brigade') in the Crimean War, 1854.

for Curtius to plunge into the gulf [7] than for any old gentleman of ninety to doff his clothes and clamber into bed.

Indeed, it is a memorable subject for consideration, with what unconcern and gaiety mankind pricks on along the Valley of the Shadow of Death. The whole way is one wilderness of snares; and the end of it, for those who fear the last pinch, is irrevocable ruin. And yet we go spinning through it all, like a party for the Derby.[8] Perhaps the reader remembers one of the humorous devices of the deified Caligula: how he encouraged a vast concourse of holiday-makers on to his bridge over Baiæ bay, and when they were in the height of their enjoyment, turned loose the Pretorian guards among the company and had them tossed into the sea.[9] This is no bad miniature of the dealings of nature with the transitory race of man. Only, what a chequered picnic we have of it, even while it lasts! and into what great waters, not to be crossed by any swimmer, God's pale Pretorian throws us over in the end!

We live the time that a match flickers; we pop the cork of a ginger-beer bottle, and the earthquake swallows us on the instant. Is it not odd, is it not incongruous, is it not, in the highest sense of human speech, incredible, that we should think so highly of the ginger-beer and regard so little the devouring earthquake? 'The love of Life' and 'the fear of Death' are two famous phrases that grow harder to understand the more we think about them. It is a well-known fact that an immense proportion of boat accidents would never happen if people held the sheet [10] in their hands instead of making it fast; and yet, unless it be some martinet of a professional mariner, or some landsman with shattered nerves, every one of God's creatures makes it fast. A strange instance of man's unconcern and brazen boldness in the face of death!

We confound ourselves with metaphysical phrases, which we import into daily talk with noble inappropriateness. We have no idea of what death is, apart from its circumstances and some of its consequences to others; and although we have some experience of living, there is not a man on earth who has flown so high into abstraction as to have any practical guess at the meaning of the word 'life.' All literature, from Job and Omar Khayyam to Thomas Carlyle or Walt Whitman, is but an attempt to look upon the human state with such largeness of view as shall enable us to rise from the consideration of living to the Definition of Life. And our sages give us about the best satisfaction in their power when they say that it is a vapour, or a show, or made out of the same stuff with dreams.[11] Philosophy, in its more rigid sense, has been at the same work for ages; and after a myriad bald heads have wagged over the problem, and piles of words have been heaped one upon another into dry and cloudy volumes without end, philosophy has the honour of laying before us, with modest pride, her contribution towards the subject: that life is a Permanent Possibility of Sensation.[12] Truly a fine result! A man may very well love beef, or hunting, or a woman; but surely, surely, not a Permanent Possibility of Sensation! He may be afraid of a preci-

7. Metius Curtius is reported to have leaped into a chasm in the Forum at Rome, dying in order to save the city.

8. A famous horse race, held annually near London.

9. Caligula (A.D. 12–41), emperor of Rome: Baiae, a summer resort town on the coast of Italy, near Naples. The Praetorian guards were the special troops of Rome itself. For the incident, see Charles Merivale, *History of the Romans under the Empire*, New York, 1879, V,331–35.

10. The rope or chain which regulates the angle at which a sail is set

11. *Cf. The Tempest*, IV,i,156.

12. John Stuart Mill's definition of matter; see his *Examination of Sir William Hamilton's Philosophy*, ed. Boston, 1865, I, xi,243. Stevenson uses Mill's capitalization.

pice, or a dentist, or a large enemy with a club, or even an undertaker's man; but not, certainly, of abstract death. We may trick with the word 'life' in its dozen senses until we are weary of tricking; we may argue in terms of all the philosophies on earth; but one fact remains true throughout — that we do not love life, in the sense that we are greatly preoccupied about its conservation; that we do not, properly speaking, love life at all, but living. Into the views of the least careful there will enter some degree of providence; no man's eyes are fixed entirely on the passing hour; but although we have some anticipation of good health, good weather, wine, active employment, love, and self-approval, the sum of these anticipations does not amount to anything like a general view of life's possibilities and issues; nor are those who cherish them most vividly at all the most scrupulous of their personal safety. To be deeply interested in the accidents of our existence, to enjoy keenly the mixed texture of human experience, rather leads a man to disregard precautions and risk his neck against a straw. For surely the love of living is stronger in an Alpine climber roping over a peril, or a hunter riding merrily at a stiff fence, than in a creature who lives upon a diet and walks a measured distance in the interest of his constitution.

There is a great deal of very vile nonsense talked upon both sides of the matter; tearing divines reducing life to the dimensions of a mere funeral procession, so short as to be hardly decent; and melancholy unbelievers yearning for the tomb as if it were a world too far away. Both sides must feel a little ashamed of their performances now and again, when they draw in their chairs to dinner. Indeed, a good meal and a bottle of wine is an answer to most standard works upon the question. When a man's heart warms to his viands, he forgets a great deal of sophistry, and soars into a rosy zone of contemplation. Death may be knocking at the door, like the Commander's statue; [13] we have something else in hand, thank God, and let him knock. Passing bells are ringing the world over. All the world over, and every hour, some one is parting company with all his aches and ecstasies. For us also the trap is laid. But we are so fond of life that we have no leisure to entertain the terror of death. It is a honeymoon with us all through, and none of the longest. Small blame to us if we give our whole hearts to this glowing bride of ours — to the appetites, to honour, to the hungry curiosity of the mind, to the pleasure of the eyes in nature, and the pride of our own nimble bodies.

We all of us appreciate the sensations; but as for caring about the Permanence of the Possibility, a man's head is generally very bald, and his senses very dull, before he comes to that. Whether we regard life as a lane leading to a dead wall — a mere bag's end, as the French say [14] — or whether we think of it as a vestibule or gymnasium, where we wait our turn and prepare our faculties for some more noble destiny; whether we thunder in a pulpit, or pule in little atheistic poetry-books, about its vanity and brevity; whether we look justly for years of health and vigour, or are about to mount into a Bath-chair [15] as a step towards the hearse; in each and all of these views and situations there is but one conclusion possible — that a man should stop his ears against paralyzing terror, and run the race that is set before him with a single mind. No one surely could have recoiled with more heartache

13. In Mozart's opera, *Don Giovanni* (Don Juan), the sinful Don murders the commandant of Seville, to whom a stone statue is later erected; this statue Don Juan invites to be his guest at a banquet; the statue comes to the banquet, and takes Don Juan off to hell.

14. The French is *cul de sac*.

15. A kind of chair on wheels, propelled by hand, as used for invalids (originally at the hot springs at Bath, England).

and terror from the thought of death than our respected lexicographer;[16] and yet we know how little it affected his conduct, how wisely and boldly he walked, and in what a fresh and lively vein he spoke of life. Already an old man, he ventured on his Highland tour; and his heart, bound with triple brass, did not recoil before twenty-seven individual cups of tea.[17] As courage and intelligence are the two qualities best worth a good man's cultivation, so it is the first part of intelligence to recognize our precarious estate in life, and the first part of courage to be not at all abashed before the fact. A frank and somewhat headlong carriage, not looking too anxiously before, not dallying in maudlin regret over the past, stamps the man who is well armoured for this world.

And not only well armoured for himself, but a good friend and a good citizen to boot. We do not go to cowards for tender dealing; there is nothing so cruel as panic; the man who has least fear for his own carcase has most time to consider others. That eminent chemist who took his walks abroad in tin shoes, and subsisted wholly upon tepid milk, had all his work cut out for him in considerate dealings with his own digestion. So soon as prudence has begun to grow up in the brain, like a dismal fungus, it finds its first expression in a paralysis of generous acts. The victim begins to shrink spiritually; he develops a fancy for parlours with a regulated temperature, and takes his morality on the principle of tin shoes and tepid milk. The care of one important body or soul becomes so engrossing that all the noises of the outer world begin to come thin and faint into the parlour with the regulated temperature, and the tin shoes go equably forward over blood and rain. To be otherwise is to ossify; and the scruple-monger ends by standing stock still. Now the man who has his heart on his sleeve, and a good whirling weathercock of a brain, who reckons his life as a thing to be dashingly used and cheerfully hazarded, makes a very different acquaintance of the world, keeps all his pulses going true and fast, and gathers impetus as he runs, until, if he be running towards anything better than wildfire, he may shoot up and become a constellation in the end. Lord look after his health, Lord have a care of his soul, says he; and he has at the key of the position, and swashes through incongruity and peril towards his aim. Death is on all sides of him with pointed batteries, as he is on all sides of all of us; unfortunate surprises gird him round; mim-mouthed friends and relations hold up their hands in quite a little elegiacal synod about his path: and what cares he for all this? Being a true lover of living, a fellow with something pushing and spontaneous on his inside, he must, like any other soldier, in any other stirring, deadly warfare, push on at his best pace until he touch the goal. 'A peerage or Westminster Abbey!' cried Nelson in his bright, boyish, heroic manner.[18] These are great incentives; not for any of these, but for the plain satisfaction of living, of being about their business in some sort or other, do the brave, serviceable men of every nation tread down the nettle danger and pass flyingly over all the stumbling-blocks of prudence. Think of the heroism of Johnson, — think of that superb indifference to mortal limitation that set him upon his dictionary, and carried him through triumphantly to the end![19] Who, if he were wisely considerate of things at large, would ever embark upon any work much more considerable than a halfpenny post-card? Who would project a serial novel, after Thackeray and Dickens had

16. Dr. Samuel Johnson.

18. Before the Battle of the Nile, August 1, 1798, in which the English under Nelson defeated the French fleet. *Cf.* Southey's *Life of Nelson*, Ch.v — in New York ed., [1902,] p.147.

19. A seven years' task — or more. *Cf.* Boswell, *op.cit.*, I,127,174.

each fallen in mid-course?[20] Who would find heart enough to begin to live, if he dallied with the consideration of death?

And, after all, what sorry and pitiful quibbling all this is! To forego all the issues of living, in a parlour with a regulated temperature — as if that were not to die a hundred times over, and for ten years at a stretch! As if it were not to die in one's own lifetime, and without even the sad immunities of death! As if it were not to die, and yet be the patient spectators of our own pitiable change! The Permanent Possibility is preserved, but the sensations carefully held at arm's length, as if one kept a photographic plate in a dark chamber. It is better to lose health like a spendthrift than to waste it like a miser. It is better to live and be done with it than to die daily in the sick room. By all means begin your folio;[21] even if the doctor does not give you a year, — even if he hesitates about a month, make one brave push and see what can be accomplished in a week. It is not only in finished undertakings that we ought to honour useful labour. A spirit goes out of the man who means execution, which outlives the most untimely ending. All who have meant good work with their whole hearts, have done good work, although they may die before they have the time to sign it. Every heart that has beat strong and cheerfully has left a hopeful impulse behind it in the world, and bettered the tradition of mankind. And even if death catch people, like an open pitfall, and in mid-career, laying out vast projects, and planning monstrous foundations, flushed with hope, and their mouths full of boastful language, they should be at once tripped up and silenced; is there not something brave and spirited in such a termination? and does not life go down with a better grace, foaming in full body over a precipice, than miserably straggling to an end in sandy deltas? When the Greeks made their fine saying that those whom the gods love die young,[22] I cannot help believing they had this sort of death also in their eye. For surely, at whatever age it overtake the man, this is to die young. Death has not been suffered to take so much as an illusion from his heart. In the hot-fit of life, a-tiptoe on the highest point of being, he passes at a bound on to the other side. The noise of the mallet and chisel is scarcely quenched, the trumpets are hardly done blowing, when, trailing with him clouds of glory,[23] this happy-starred, full-blooded spirit shoots into the spiritual land.

20 Thackeray was writing the serial *Denis Duval* when he died; Dickens, *The Mystery of Edwin Drood*.

21. *Folio*: book with pages of the largest size.

22. See Menander, *Fragments*, 125K.

23. *Cf.* Wordsworth's *Ode on Intimations of Immortality*, ll.64–65: 'trailing clouds of glory do we come From God, who is our home.'

MEMORIES AND PORTRAITS

Pulvis et Umbra[1]

We look for some reward of our endeavours and are disappointed; not success, not happiness, not even peace of conscience, crowns our ineffectual efforts to do well. Our frailties are invincible, our virtues barren; the battle goes sore against us to the going down of the sun. The canting moralist tells us of right and wrong; and we look abroad, even on the face of our small earth, and find them change with every climate, and no country where some action is not honoured for a virtue and none where it is not branded for a vice; and we look in our experience, and find no vital congruity in the wisest rules, but at the best a municipal fitness. It is not strange if we are tempted to despair of

1. 'Dust and shadow.' See Horace, *Odes*, IV,vii, 14–16: 'We, when we have fallen to that place whither fell Father Aeneas, rich Tullus, and Ancus, are but dust and shadow.'

good. We ask too much. Our religions and moralities have been trimmed to flatter us, till they are all emasculate and sentimentalised, and only please and weaken. Truth is of a rougher strain. In the harsh face of life, faith can read a bracing gospel. The human race is a thing more ancient than the Ten Commandments; and the bones and revolutions of the Kosmos, in whose joints we are but moss and fungus, more ancient still.

I

Of the Kosmos in the last resort, science reports many doubtful things and all of them appalling. There seems no substance to this solid globe on which we stamp, — nothing but symbols and ratios. Symbols and ratios carry us and bring us forth and beat us down; gravity, that swings the incommensurable suns and worlds through space, is but a figment varying inversely as the squares of distances; and the suns and worlds themselves, imponderable figures of abstraction — NH_3 and H_2O. Consideration dares not dwell upon this view; that way madness lies; science carries us into zones of speculation where there is no habitable city for the mind of man.

But take the Kosmos with a grosser faith, as our senses give it us. We behold space sown with rotatory islands, suns and worlds and the shards and wrecks of systems; some, like the sun, still blazing; some rotting, like the earth; others, like the moon, stable in desolation. All of these we take to be made of something we call matter, — a thing which no analysis can help us to conceive, to whose incredible properties no familiarities can reconcile our minds. This stuff, when not purified by the lustration of fire, rots uncleanly into something we call life; seized through all its atoms with a pediculous malady; swelling in tumours that become independent, sometimes even (by an abhorrent prodigy) locomotory; one splitting into millions, millions cohering into one, as the malady proceeds through varying stages. This vital putrescence of the dust, used as we are to it, yet strikes us with occasional disgust, and the profusion of worms in a piece of ancient turf, or the air of a marsh darkened with insects, will sometimes check our breathing so that we aspire for cleaner places. But none is clean: the moving sand is infected with lice; the pure spring, where it bursts out of the mountain, is a mere issue of worms; even in the hard rock the crystal is forming.

In two main shapes this eruption covers the countenance of the earth: the animal and the vegetable: one in some degree the inversion of the other: the second rooted to the spot; the first coming detached out of its natal mud, and scurrying abroad with the myriad feet of insects, or towering into the heavens on the wings of birds, — a thing so incomprehensible that, if it be well considered, the heart stops. To what passes with the anchored vermin, we have little clue: doubtless they have their joys and sorrows, their delights and killing agonies, — it appears not how. But of the locomotory, to which we ourselves belong, we can tell more. These share with us a thousand miracles: the miracles of sight, of hearing, of the projection of sound, things that bridge space; the miracles of memory and reason, by which the present is conceived, and when it is gone its image kept living in the brains of man and brute; the miracle of reproduction, with its imperious desires and staggering consequences. And to put the last touch upon this mountain mass of the revolting and the inconceivable, all these prey upon each other, lives tearing other lives in pieces, cramming them inside themselves, and by that summary process growing fat: the vegetarian, the whale, perhaps the tree, not less than the lion of the desert, — for the vegetarian is only the eater of the dumb.

Meanwhile our rotatory island loaded with predatory life, and more drenched with blood, both animal and vegetable, than ever mutinied ship, scuds through

space with unimaginable speed, and turns alternate cheeks to the reverberation of a blazing world ninety million miles away.

II

What a monstrous spectre is this man, the disease of the agglutinated dust, lifting alternate feet or lying drugged with slumber; killing, feeding, growing, bringing forth small copies of himself; grown upon with hair like grass, fitted with eyes that move and glitter in his face; a thing to set children screaming; — and yet looked at nearlier, known as his fellows know him, how surprising are his attributes! Poor soul, here for so little, cast among so many hardships, filled with desires so incommensurate and so inconsistent, savagely surrounded, savagely descended, irremediably condemned to prey upon his fellow lives: who should have blamed him had he been of a piece with his destiny and a being merely barbarous? And we look and behold him instead filled with imperfect virtues: infinitely childish, often admirably valiant, often touchingly kind; sitting down, amidst his momentary life, to debate of right and wrong and the attributes of the deity; rising up to do battle for an egg or die for an idea; singling out his friends and his mate with cordial affection; bringing forth in pain, rearing with long-suffering solicitude, his young. To touch the heart of his mystery, we find in him one thought, strange to the point of lunacy: the thought of duty; the thought of something owing to himself, to his neighbour, to his God; an ideal of decency, to which he would rise if it were possible; a limit of shame below which, if it be possible, he will not stoop. The design in most men is one of conformity; here and there, in picked natures, it transcends itself and soars on the other side, arming martyrs with independence; but in all, in their degrees, it is a bosom thought: — not in man alone, for we trace it in dogs and cats whom we know fairly well, and doubtless some similar point of honour sways the elephant, the oyster, and the louse, of whom we know so little: — but in man, at least, it sways with so complete an empire that merely selfish things come second, even with the selfish; that appetites are starved, fears are conquered, pains supported; that almost the dullest shrinks from the reproof of a glance, although it were a child's; and all but the most cowardly stand amid the risks of war; and the more noble, having strongly conceived an act as due to their ideal, affront and embrace death. Strange enough if, with their singular origin and perverted practice, they think they are to be rewarded in some future life; stranger still, if they are persuaded of the contrary, and think this blow which they solicit will strike them senseless for eternity. I shall be reminded what a tragedy of misconception and misconduct man at large presents, — of organized injustice, cowardly violence, and treacherous crime, and of the damning imperfections of the best. They cannot be too darkly drawn. Man is indeed marked for failure in his efforts to do right. But where the best consistently miscarry, how tenfold more remarkable that all should continue to strive; and surely we should find it both touching and inspiriting, that in a field from which success is banished, our race should not cease to labour.

If the first view of this creature, stalking in his rotatory isle, be a thing to shake the courage of the stoutest, on this nearer sight he startles us with an admiring wonder. It matters not where we look, under what climate we observe him, in what state of society, in what depth of ignorance, burthened with what erroneous morality; by camp-fires in Assiniboia,[2] the snow powdering his shoulders, the wind plucking his blanket, as he sits, passing the ceremonial calumet [3] and uttering his

2. The Sioux Indian country of north-central North America.

3. *Calumet*: pipe, smoked as a symbol of peace, by North American Indians.

grave opinions like a Roman senator; in ships at sea, a man inured to hardship and vile pleasures, his brightest hope a fiddle in a tavern and a bedizened trull who sells herself to rob him, and he for all that simple, innocent, cheerful, kindly like a child, constant to toil, brave to drown, for others; in the slums of cities, moving among indifferent millions to mechanical employments, without hope of change in the future, with scarce a pleasure in the present, and yet true to his virtues, honest up to his lights, kind to his neighbours, tempted perhaps in vain by the bright gin-palace, perhaps long-suffering with the drunken wife that ruins him; in India (a woman this time) kneeling with broken cries and streaming tears, as she drowns her child in the sacred river;[4] in the brothel, the discard of society, living mainly on strong drink, fed with affronts, a fool, a thief, the comrade of thieves, and even here keeping the point of honour and the touch of pity, often repaying the world's scorn with service, often standing firm upon a scruple, and at a certain cost rejecting riches: — everywhere some virtue cherished or affected, everywhere some decency of thought and carriage, everywhere the ensign of man's ineffectual goodness:—ah! if I could show you this! If I could show you these men and women, all the world over, in every stage of history, under every abuse of error, under every circumstance of failure, without hope, without help, without thanks, still obscurely fighting the lost fight of virtue, still clinging, in the brothel or on the scaffold, to some rag of honour, the poor jewel of their souls![5] They may seek to escape, and yet they cannot; it is not alone their privilege and glory, but their doom; they are condemned to some nobility, all their lives long, the desire of good is at their heels, the implacable hunter.

Of all earth's meteors, here at least is the most strange and consoling: that this ennobled lemur,[6] this hair-crowned bubble of the dust, this inheritor of a few years and sorrows, should yet deny himself his rare delights, and add to his frequent pains, and live for an ideal, however misconceived. Nor can we stop with man. A new doctrine,[7] received with screams a little while ago by canting moralists, and still not properly worked into the body of our thoughts, lights us a step farther into the heart of this rough but noble universe. For nowadays the pride of man denies in vain his kinship with the original dust. He stands no longer like a thing apart. Close at his heels we see the dog, prince of another genus; and in him too we see dumbly testified the same cultus of an unattainable ideal, the same constancy in failure. Does it stop with the dog? We look at our feet where the ground is blackened with the swarming ant; a creature so small, so far from us in the hierarchy of brutes, that we can scarce trace and scarce comprehend his doings; and here also, in his ordered polities and rigorous justice, we see confessed the law of duty and the fact of individual sin. Does it stop, then, with the ant? Rather this desire of well-doing and this doom of frailty run through all the grades of life: rather is this earth, from the frosty top of Everest to the next margin of the internal fire, one stage of ineffectual virtues and one temple of pious tears and perseverance. The whole creation groaneth and travaileth together.[8] It is the common and the god-like law of life. The browsers, the biters, the barkers, the hairy coats of field and forest, the squirrel in the oak, the thousand-footed creeper in the dust, as they share with us the gift of life, share with us the love of an ideal; strive like us — like us are tempted to

7. The doctrine of evolution.
8. *Cf. Romans*, viii,22.

grow weary of the struggle — to do well; like us receive at times unmerited refreshment, visitings of support, returns of courage; and are condemned like us to be crucified between that double law of the members and the will.[9] Are they like us, I wonder, in the timid hope of some reward, some sugar with the drug? do they, too, stand aghast at unrewarded virtues, at the sufferings of those whom, in our partiality, we take to be just, and the prosperity of such as in our blindness we call wicked? It may be, and yet God knows what they should look for. Even while they look, even while they repent, the foot of man treads them by thousands in the dust, the yelping hounds burst upon their trail, the bullet speeds, the knives are heating in the den of the vivisectionist; or the dew falls, and the generation of a day is blotted out. For these are creatures compared with whom our weakness is strength, our ignorance wisdom, our brief span eternity.

And as we dwell, we living things, in our isle of terror and under the imminent hand of death, God forbid it should be man the erected, the reasoner, the wise in his own eyes — God forbid it should be man that wearies in well-doing, that despairs of unrewarded effort, or utters the language of complaint. Let it be enough for faith, that the whole creation groans in mortal frailty, strives with unconquerable constancy: surely not all in vain.

9. *Cf. Romans*, VII,23.

ESSAYS ON LITERATURE, ON NATURE, ETC.

Essays on Literature

IV

On Some Technical Elements of Style in Literature

THERE is nothing more disenchanting to man than to be shown the springs and mechanism of any art. All our arts and occupations lie wholly on the surface: it is on the surface that we perceive their beauty, fitness, and significance: and to pry below is to be appalled by their emptiness and shocked by the coarseness of the strings and pulleys. In a similar way, psychology itself, when pushed to any nicety, discovers an abhorrent baldness, but rather from the fault of our analysis than from any poverty native to the mind. And perhaps in æsthetics the reason is the same: those disclosures which seem fatal to the dignity of art seem so perhaps only in the proportion of our ignorance; and those conscious and unconscious artifices which it seems unworthy of the serious artist to employ were yet, if we had the power to trace them to their springs, indications of a delicacy of the sense finer than we conceive, and hints of ancient harmonies in nature. This ignorance at least is largely irremediable. We shall never learn the affinities of beauty, for they lie too deep in nature and too far back in the mysterious history of man. The amateur, in consequence, will always grudgingly receive details of method, which can be stated but never can wholly be explained; nay, on the principle laid down in *Hudibras*, that [1]

> 'Still the less they understand,
> The more they admire the sleight-of-hand,'

many are conscious at each new disclosure of a diminution in the ardour of their pleasure. I must therefore warn that well-known character, the general reader, that I am here embarked upon a most distasteful business: taking down the picture from the wall and looking on the back; and, like the inquiring child, pulling the musical cart to pieces.

1. *Choice of Words.* — The art of literature stands apart from among its sisters,

1. Samuel Butler, *Hudibras*, II,iii,5–6. The preceding lines state that 'lookers-on feel most delight That least perceive a juggler's sleight.'

because the material in which the literary artist works is the dialect of life; hence, on the one hand, strange freshness and immediacy of address to the public mind, which is ready prepared to understand it; but hence, on the other, a singular limitation. The sister arts enjoy the use of a plastic and ductile material, like the modeller's clay; literature alone is condemned to work in mosaic with finite and quite rigid words. You have seen these blocks dear to the nursery: this one a pillar, that a pediment, a third a window or a vase. It is with blocks of just such arbitrary size and figure that the literary architect is condemned to design the palace of his art. Nor is this all; for since these blocks, or words, are the acknowledged currency of our daily affairs, there are here possible none of those suppressions by which other arts obtain relief, continuity, and vigour: no hieroglyphic touch, no smoothed impasto,[2] no inscrutable shadow, as in painting; no blank wall, as in architecture; but every word, phrase, sentence, and paragraph must move in a logical progression, and convey a definite conventional import.

Now the first merit which attracts in the pages of a good writer, or the talk of a brilliant conversationalist, is the apt choice and contrast of the words employed. It is, indeed, a strange art to take these blocks, rudely conceived for the purpose of the market or the bar, and by tact of application touch them to the finest meanings and distinctions; restore to them their primal energy, wittily shift them to another issue, or make of them a drum to rouse the passions. But though this form of merit is without doubt the most sensible and seizing, it is far from being equally present in all writers. The effect of words in Shakespeare, their singular justice, significance, and poetic charm, is different, indeed, from the effect of words in Addison or Fielding. Or, to take an example nearer home, the words of Carlyle seem electrified into an energy of lineament, like the faces of men furiously moved; whilst the words in Macaulay, apt enough to convey his meaning, harmonious enough in sound, yet glide from the memory like undistinguished elements in a general effect. But the first class of writers have no monopoly of literary merit. There is a sense in which Addison is superior to Carlyle; a sense in which Cicero is better than Tacitus, in which Voltaire excels Montaigne: it certainly lies not in the choice of words; it lies not in the interest or value of the matter; it lies not in force of intellect, or poetry, or of humour. The three first are but infants to the three second; and yet each, in a particular point of literary art, excels his superior in the whole. What is that point?

2. *The Web.* — Literature, although it stands apart by reason of the great destiny and general use of its medium in the affairs of men, is yet an art like other arts. Of these we may distinguish two great classes: those arts, like sculpture, painting, acting, which are representative, or as used to be said very clumsily, imitative; and those, like architecture, music, and the dance, which are self-sufficient, and merely presentative. Each class, in right of this distinction, obeys principles apart; yet both may claim a common ground of existence, and it may be said with sufficient justice that the motive and end of any art whatever, is to make a pattern; a pattern, it may be, of colours, of sounds, of changing attitudes, geometrical figures, or imitative lines; but still a pattern. That is the plane on which these sisters meet; it is by this that they are arts; and if it be well they should at times forget their childish origin, addressing their intelligence to virile tasks, and performing unconsciously that necessary function of their life, to make a pattern, it is still imperative that the pattern shall be made.

Music and literature, the two temporal arts, contrive their pattern of sounds in

2. *Impasto*: in painting, the application of thick and opaque oil-color to a canvas to give relief, force, and solidity to the objects represented.

time; or, in other words, of sounds and pauses. Communication may be made in broken words, the business of life be carried on with substantives alone; but that is not what we call literature; and the true business of the literary artist is to plait or weave his meaning, involving it around itself so that each sentence, by successive phrases, shall first come into a kind of knot, and then, after a moment of suspended meaning, solve and clear itself. In every properly constructed sentence there should be observed this knot or hitch; so that (however delicately) we are led to foresee, to expect, and then to welcome the successive phrases. The pleasure may be heightened by an element of surprise, as, very grossly, in the common figure of the antithesis, or, with much greater subtlety, where an antithesis is first suggested and then deftly evaded. Each phrase, besides, is to be comely in itself; and between the implication and the evolution of the sentence there should be a satisfying equipoise of sound; for nothing more often disappoints the ear than a sentence solemnly and sonorously prepared, and hastily and weakly finished. Nor should the balance be too striking and exact, for the one rule is to be infinitely various; to interest, to disappoint, to surprise, and yet still to gratify; to be ever changing, as it were, the stitch, and yet still to give the effect of an ingenious neatness.

The conjuror juggles with two oranges, and our pleasure in beholding him springs from this, that neither is for an instant overlooked or sacrificed. So with the writer. His pattern, which is to please the supersensual ear, is yet addressed, throughout and first of all, to the demands of logic. Whatever be the obscurities, whatever the intricacies of the argument, the neatness of the fabric must not suffer, or the artist has been proved unequal to his design. And, on the other hand, no form of words must be selected, no knot must be tied among the phrases, unless knot and word be precisely what is wanted to forward and illuminate the argument; for to fail in this is to swindle in the game. The genius of prose rejects the *cheville*[3] no less emphatically than the laws of verse; and the *cheville*, I should perhaps explain to some of my readers, is any meaningless or very watered phrase employed to strike a balance in the sound. Pattern and argument live in each other; and it is by the brevity, clearness, charm, or emphasis of the second, that we judge the strength and fitness of the first.

Style is synthetic; and the artist, seeking, so to speak, a peg to plait about, takes up at once two or more elements or two or more views of the subject in hand; combines, implicates, and contrasts them; and while, in one sense, he was merely seeking an occasion for the necessary knot, he will be found, in the other, to have greatly enriched the meaning, or to have transacted the work of two sentences in the space of one. In the change from the successive shallow statements of the old chronicler to the dense and luminous flow of highly synthetic narrative, there is implied a vast amount of both philosophy and wit. The philosophy we clearly see, recognising in the synthetic writer a far more deep and stimulating view of life, and a far keener sense of the generation and affinity of events. The wit we might imagine to be lost, but it is not so, for it is just that wit, these perpetual nice contrivances, these difficulties overcome, this double purpose attained, these two oranges kept simultaneously dancing in the air, that, consciously or not, afford the reader his delight. Nay, and this wit, so little recognised, is the necessary organ of that philosophy which we so much admire. That style is therefore the most perfect, not, as fools say, which is the most natural, for the most natural is the disjointed babble of the chronicler; but which attains the highest degree of elegant and

3. 'an expletive, redundant word or phrase used unnecessarily to fill out, or "pad" an expression.'

pregnant implication unobtrusively; or if obtrusively, then with the greatest gain to sense and vigour. Even the derangement of the phrases from their (so-called) natural order is luminous for the mind; and it is by the means of such designed reversal that the elements of a judgment may be most pertinently marshalled, or the stages of a complicated action most perspicuously bound into one.

The web, then, or the pattern: a web at once sensuous and logical, an elegant and pregnant texture: that is style, that is the foundation of the art of literature. Books indeed continue to be read, for the interest of the fact or fable, in which this quality is poorly represented, but still it will be there. And, on the other hand, how many do we continue to peruse and re-peruse with pleasure whose only merit is the elegance of texture? I am tempted to mention Cicero, and since Mr. Anthony Trollope [4] is dead, I will. It is a poor diet for the mind, a very colourless and toothless 'criticism of life'; [5] but we enjoy the pleasure of a most intricate and dexterous pattern, every stitch a model at once of elegance and of good sense; and the two oranges, even if one of them be rotten, kept dancing with inimitable grace.

Up to this moment I have had my eye mainly upon prose; for though in verse also the implication of the logical texture is a crowning beauty, yet in verse it may be dispensed with. You would think that here was a death-blow to all I have been saying; and, far from that, it is but a new illustration of the principle involved. For if the versifier is not bound to weave a pattern of his own, it is because another pattern has been formally imposed upon him by the laws of verse. For that is the essence of a prosody. Verse may be rhythmical; it may be merely alliterative; it may, like the French, depend wholly on the (quasi) regular recurrence of the rhyme; or, like the Hebrew, it may consist in the strangely fanciful device of repeating the same idea. It does not matter on what principle the law is based, so it be a law. It may be pure convention; it may have no inherent beauty; all that we have a right to ask of any prosody is, that it shall lay down a pattern for the writer, and that what it lays down shall be neither too easy nor too hard. Hence it comes that it is much easier for men of equal facility to write fairly pleasing verse than reasonably interesting prose; for in prose the pattern itself has to be invented, and the difficulties first created before they can be solved. Hence, again, there follows the peculiar greatness of the true versifier: such as Shakespeare, Milton, and Victor Hugo, whom I place beside them as versifier merely, not as poet. These not only knit and knot the logical texture of the style with all the dexterity and strength of prose; they not only fill up the pattern of the verse with infinite variety and sober wit; but they give us, besides, a rare and special pleasure, by the art, comparable to that of counterpoint, with which they follow at the same time, and now contrast, and now combine, the double pattern of the texture and the verse. Here the sounding line concludes; a little further on, the well-knit sentence; and yet a little further, and both will reach their solution on the same ringing syllable. The best that can be offered by the best writer of prose is to show us the development of the idea and the stylistic pattern proceed hand in hand, sometimes by an obvious and triumphant effort, sometimes with a great air of ease and nature. The writer of verse, by virtue of conquering another difficulty, delights us with a new series of triumphs. He follows three purposes where his rival followed only two; and the change is of precisely the same nature as that from melody to harmony. Or if you prefer to return to the juggler, behold him now, to the vastly

4. A great admirer of Cicero, Trollope wrote for the *Fortnightly Review* articles on Cicero that were published separately in 1880.

5. The phrase is Arnold's; *cf.* his essays on Joubert and Wordsworth.

increased enthusiasm of the spectators, juggling with three oranges instead of two. Thus it is: added difficulty, added beauty; and the pattern, with every fresh element, becoming more interesting in itself.

Yet it must not be thought that verse is simply an addition; something is lost as well as something gained; and there remains plainly traceable, in comparing the best prose with the best verse, a certain broad distinction of method in the web. Tight as the versifier may draw the knot of logic, yet for the ear he still leaves the tissue of the sentence floating somewhat loose. In prose, the sentence turns upon a pivot, nicely balanced, and fits into itself with an obtrusive neatness like a puzzle. The ear remarks and is singly gratified by this return and balance; while in verse it is all diverted to the measure. To find comparable passages is hard; for either the versifier is hugely the superior of the rival, or, if he be not, and still persist in his more delicate enterprise, he fails to be as widely his inferior. But let us select them from the pages of the same writer, one who was ambidexter; let us take, for instance, Rumour's Prologue to the Second Part of *Henry IV*, a fine flourish of eloquence in Shakespeare's second manner, and set it side by side with Falstaff's praise of sherris,[6] act IV. scene i.; or let us compare the beautiful prose spoken throughout by Rosalind and Orlando;[7] compare, for example, the first speech of all, Orlando's speech to Adam, with what passage it shall please you to select — the Seven Ages from the same play, or even such a stave of nobility as Othello's farewell to war; and still you will be able to perceive, if you have an ear for that class of music, a certain superior degree of organisation in the prose; a compacter fitting of the parts; a balance in the swing and the return as of a throbbing pendulum. We must not, in things temporal, take from those who have little, the little that they have; the merits of prose are inferior, but they are not the same; it is a little kingdom, but an independent.

3. *Rhythm of the Phrase.* — Some way back, I used a word which still awaits an application. Each phrase, I said, was to be comely; but what is a comely phrase? In all ideal and material points, literature, being a representative art, must look for analogies to painting and the like; but in what is technical and executive, being a temporal art, it must seek for them in music. Each phrase of each sentence, like an air or a recitative in music, should be so artfully compounded out of long and short, out of accented and unaccented, as to gratify the sensual ear. And of this the ear is the sole judge. It is impossible to lay down laws. Even in our accentual and rhythmic language no analysis can find the secret of the beauty of a verse; how much less then, of those phrases, such as prose is built of, which obey no law but to be lawless and yet to please? The little that we know of verse (and for my part I owe it all to my friend Professor Fleeming Jenkin)[8] is, however, particularly interesting in the present connexion. We have been accustomed to describe the heroic line as five iambic feet, and to be filled with pain and confusion whenever, as by the conscientious schoolboy, we have heard our own description put in practice.

'All nìght | the dreàd | less àn | gel ùn | pursùed,'[9]

goes the schoolboy; but though we close our ears, we cling to our definition, in

6. 'Sherry.' See *II Henry IV*, IV,iii.103ff.

7. Chief characters in *As You Like It*. The speech on the Seven Ages begins 'All the world's a stage' (II,vii,139ff.); for Othello's farewell to war, see *Othello*, III,iii,347ff.

8. Henry Charles Fleeming Jenkin (1833–85), professor of engineering in University College, London, and in Edinburgh University. His *Papers Literary, Scientific, &c.*, ed. Colvin and Ewing, with a memoir by R.L.Stevenson, 2 vols., 1887, has an essay on 'Rhythm in English Verse' (I,149–70).

9. Milton, *Paradise Lost*, vi,1.

spite of its proved and naked insufficiency. Mr. Jenkin was not so easily pleased, and readily discovered that the heroic line consisted of four groups, or, if you prefer the phrase, contains four pauses:

'All night | the dreadless | angel | unpursued.'

Four groups, each practically uttered as one word: the first, in this case, an iamb; the second, an amphibrachys; the third, a trochee; and the fourth, an amphimacer;[10] and yet our schoolboy, with no other liberty but that of inflicting pain, had triumphantly scanned it as five iambs. Perceive, now, this fresh richness of intricacy in the web; this fourth orange, hitherto unremarked, but still kept flying with the others. What had seemed to be one thing it now appears is two; and, like some puzzle in arithmetic, the verse is made at the same time to read in fives and to read in fours.

But again, four is not necessary. We do not, indeed, find verses in six groups, because there is not room for six in the ten syllables; and we do not find verses of two, because one of the main distinctions of verse from prose resides in the comparative shortness of the group; but it is even common to find verses of three. Five is the one forbidden number; because five is the number of the feet; and if five were chosen, the two patterns would coincide, and that opposition which is the life of verse would instantly be lost. We have here a clue to the effect of polysyllables, above all in Latin, where they are so common and make so brave an architecture in the verse; for the polysyllable is a group of Nature's making. If but some Roman would return from Hades (Martial,[11] for choice), and tell me by what conduct of the voice these thundering verses should be uttered — '*Aut Lacedæmonium Tarentum*,'[12] for a case in point — I feel as if I should enter at last into the full enjoyment of the best of human verses.

But, again, the five feet are all iambic, or supposed to be; by the mere count of syllables the four groups cannot be all iambic; as a question of elegance, I doubt if any one of them requires to be so; and I am certain that for choice no two of them should scan the same. The singular beauty of verse analysed above is due, so far as analysis can carry us, part, indeed, to the clever repetition of L, D, and N, but part to this variety of scansion in the groups. The groups which, like the bar in music, break up the verse for utterance, fall uniambically; and in declaiming a so-called iambic verse, it may so happen that we never utter one iambic foot. And yet to this neglect of the original beat there is a limit.

'Athens, the eye of Greece, mother of arts,'[13]

is, with all its eccentricities, a good heroic line; for though it scarcely can be said to indicate the beat of the iamb, it certainly suggests no other measure to the ear. But begin

'Mother Athens, eye of Greece,'

or merely 'Mother Athens,' and the game is up, for the trochaic beat has been suggested. The eccentric scansion of the groups is an adornment; but as soon as the original beat has been forgotten, they cease implicitly to be eccentric. Variety is what is sought; but if we destroy the original mould, one of the terms of this variety is lost, and we fall back on sameness. Thus, both as to the arithmetical measure of the verse, and the degree of regularity in scansion, we see the laws of prosody to have

10. *Iamb*: an unaccented syllable followed by an accented; *amphibrachys*: an unaccented syllable, an accented, then an unaccented; *trochee*: an accented syllable, then an unaccented; *amphimacer*: an accented syllable, an unaccented, then an accented.

11. Roman poet, epigrammatist (A.D. 40?–100?), an admirer of Horace.

12. 'Or Tarentum of the Spartans.' See Horace, *Odes*, III,v,56.

13. Milton, *Paradise Regained*, iv,240.

one common purpose: to keep alive the opposition of two schemes simultaneously followed; to keep them notably apart, though still coincident; and to balance them with such judicial nicety before the reader, that neither shall be unperceived and neither signally prevail.

The rule of rhythm in prose is not so intricate. Here, too, we write in groups, or phrases, as I prefer to call them, for the prose phrase is greatly longer and is much more nonchalantly uttered than the group in verse; so that not only is there a greater interval of continuous sound between the pauses, but, for that very reason, word is linked more readily to word by a more summary enunciation. Still, the phrase is the strict analogue of the group, and successive phrases, like successive groups, must differ openly in length and rhythm. The rule of scansion in verse is to suggest no measure but the one in hand; in prose, to suggest no measure at all. Prose must be rhythmical, and it may be as much so as you will; but it must not be metrical. It may be anything, but it must not be verse. A single heroic line may very well pass and not disturb the somewhat larger stride of the prose style; but one following another will produce an instant impression of poverty, flatness, and disenchantment. The same lines delivered with the measured utterance of verse would perhaps seem rich in variety. By the more summary enunciation proper to prose, as to a more distant vision, these niceties of difference are lost. A whole verse is uttered as one phrase; and the ear is soon wearied by a succession of groups identical in length. The prose writer, in fact, since he is allowed to be so much less harmonious, is condemned to a perpetually fresh variety of movement on a larger scale, and must never disappoint the ear by the trot of an accepted metre. And this obligation is the third orange with which he has to juggle, the third quality which the prose writer must work into his pattern of words. It may be thought perhaps that this is a quality of ease rather than a fresh difficulty; but such is the inherently rhythmical strain of the English language, that the bad writer — and must I take for example that admired friend of my boyhood, Captain Reid? [14] — the inexperienced writer, as Dickens in his earlier attempts to be impressive, and the jaded writer, as any one may see for himself, all tend to fall at once into the production of bad blank verse. And here it may be pertinently asked, Why bad? And I suppose it might be enough to answer that no man ever made good verse by accident, and that no verse can ever sound otherwise than trivial when uttered with the delivery of prose. But we can go beyond such answers. The weak side of verse is the regularity of the beat, which in itself is decidedly less impressive than the movement of the nobler prose; and it is just into this weak side, and this alone, that our careless writer falls. A peculiar density and mass consequent on the nearness of the pauses is one of the chief good qualities of verse; but this our accidental versifier, still following after the swift gait and large gestures of prose, does not so much as aspire to imitate. Lastly, since he remains unconscious that he is making verse at all, it can never occur to him to extract those effects of counterpoint and opposition which I have referred to as the final grace and justification of verse, and, I may add, of blank verse in particular.

4. *Contents of the Phrase.* — Here is a great deal of talk about rhythm — and naturally; for in our canorous language, rhythm is always at the door. But it must not be forgotten that in some languages this element is almost, if not quite, extinct, and that in our own it is probably decaying. The even speech of many educated Americans sounds the note of danger. I should see it go with something as bitter as despair, but I should not be desperate. As in verse no element, not even

14. Mayne Reid (1818–83), Irish-American novelist.

rhythm, is necessary, so, in prose also, other sorts of beauty will arise and take the place and play the part of those that we outlive. The beauty of the expected beat in verse, the beauty in prose of its larger and more lawless melody, patent as they are to English hearing, are already silent in the ears of our next neighbours; for France the oratorical accent and the pattern of the web have almost or altogether succeeded to their places; and the French prose writer would be astounded at the labours of his brother across the Channel, and how a good quarter of his toil, above all *invita Minerva*,[15] is to avoid writing verse. So wonderfully far apart have races wandered in spirit, and so hard it is to understand the literature next door!

Yet French prose is distinctly better than English; and French verse, above all while Hugo lives, it will not do to place upon one side. What is more to our purpose, a phrase or a verse in French is easily distinguishable as comely or uncomely. There is then another element of comeliness hitherto overlooked in this analysis: the contents of the phrase. Each phrase in literature is built of sounds, as each phrase in music consists of notes. One sound suggests, echoes, demands, and harmonises with another; and the art of rightly using these concordances is the final art in literature. It used to be a piece of good advice to all young writers to avoid alliteration; and the advice was sound, in so far as it prevented daubing. None the less for that was it abominable nonsense, and the mere raving of those blindest of the blind who will not see. The beauty of the contents of a phrase, or of a sentence, depends implicitly upon alliteration and upon assonance. The vowel demands to be repeated; the consonant demands to be repeated; and both cry aloud to be perpetually varied. You may follow the adventures of a letter through any passage that has particularly pleased you; find it, perhaps, denied awhile, to tantalise the ear; find it fired again at you in a whole broadside; or find it pass into congenerous sounds, one liquid or labial melting away into another. And you will find another and much stranger circumstance. Literature is written by and for two senses: a sort of internal ear, quick to perceive 'unheard melodies';[16] and the eye, which directs the pen and deciphers the printed phrase. Well, even as there are rhymes for the eye, so you will find that there are assonances and alliterations; that where an author is running the open A, deceived by the eye and our strange English spelling, he will often show a tenderness for the flat A, and that where he is running a particular consonant, he will not improbably rejoice to write it down even when it is mute or bears a different value.

Here, then, we have a fresh pattern — a pattern, to speak grossly, of letters — which makes the fourth preoccupation of the prose writer, and the fifth of the versifier. At times it is very delicate and hard to perceive, and then perhaps most excellent and winning (I say perhaps); but at times again the elements of this literal melody stand more boldly forward and usurp the ear. It becomes, therefore, somewhat a matter of conscience to select examples; and as I cannot very well ask the reader to help me, I shall do the next best by giving him the reason or the history of each selection. The two first, one in prose, one in verse, I chose without previous analysis, simply as engaging passages that had long re-echoed in my ear.

'I cannot praise a fugitive and cloistered virtue, unexercised and unbreathed, that never sallies out and sees her adversary, but slinks out of the race where that immortal garland is to be run for, not with-

15. 'Minerva being unwilling'; hence, without inspiration, done under compulsion. *Cf.* Horace, *Art of Poetry*, l.385.

16. *Cf.* Keats, 'Ode on a Grecian Urn,' ll.11–12

out dust and heat.'[17] Down to 'virtue,' the current S and R are both announced and repeated unobtrusively, and by way of a grace-note that almost inseparable group PVF is given entire.[18] The next phrase is a period of repose, almost ugly in itself, both S and R still audible, and B given as the last fulfilment of PVF. In the next four phrases, from 'that never' down to 'run for,' the mask is thrown off, and, but for a slight repetition of the F and V, the whole matter turns, almost too obtrusively, on S and R; first S coming to the front, and then R. In the concluding phrase all these favourite letters, and even the flat A, a timid preference for which is just perceptible, are discarded at a blow and in a bundle; and to make the break more obvious, every word ends with a dental, and all but one with T, for which we have been cautiously prepared since the beginning. The singular dignity of the first clause, and this hammer-stroke of the last, go far to make the charm of this exquisite sentence. But it is fair to own that S and R are used a little coarsely.

'In Xanadu did Kubla Khan
(KĂNDL)
A stately pleasure dome decree,
(KDLSR)
Where Alph the sacred river ran,
(KĂNDLSR)
Through caverns measureless to man,
(KĂNLSR)
Down to a sunless sea.'[19]
(NDLS)

Here I have put the analysis of the main group alongside the lines; and the more it is looked at, the more interesting it will seem. But there are further niceties. In lines two and four, the current S is most delicately varied with Z. In line three, the current flat A is twice varied with the open A, already suggested in line two, and both times ('where' and 'sacred') in conjunction with the current R. In the same line F and V (a harmony in themselves, even when shorn of their comrade P) are admirably contrasted. And in line four there is a marked subsidiary M, which again was announced in line two. I stop from weariness, for more might yet be said.

My next example was recently quoted from Shakespeare as an example of the poet's colour sense. Now, I do not think literature has anything to do with colour, or poets anyway the better of such a sense; and I instantly attacked this passage, since 'purple' was the word that had so pleased the writer of the article, to see if there might not be some literary reason for its use. It will be seen that I succeeded amply; and I am bound to say I think the passage exceptional in Shakespeare — exceptional, indeed, in literature; but it was not I who chose it.

'The BaRge she sat iN, like a BURNished throNe
BURNt oN the water: the POOP was BeateN gold,
PURPle the sails and so PUR* Fumèd that *per
The wiNds were love-sick with them.'[20]

It may be asked why I have put the F of 'perfumed' in capitals; and I reply, because this change from P to F is the completion of that from B to P, already so adroitly carried out. Indeed, the whole passage is a monument of curious ingenuity; and it seems scarce worth while to indicate the subsidiary S, L, and W. In the same

17. Milton. [Stevenson's note.] It is from the *Areopagitica* — *cf.* the Everyman Ed., p.13.

18. As PVF will continue to haunt us through our English examples, take, by way of comparison, this Latin verse, of which it forms a chief adornment, and do not hold me answerable for the all-too-Roman freedom of the sense: 'Hanc volo, quae facilis, quae palliolata vagatur.' [Stevenson's note.] The sense is: 'I wish that woman who is easy to obtain, who, hooded, strolls about.'

19. Coleridge. [Stevenson's note.]

20. *Antony and Cleopatra.* [Stevenson's note.] See Act II, Sc.ii, ll.196ff.

article, a second passage from Shakespeare was quoted, once again as an example of his colour sense:

'A mole cinque-spotted like the crimson drops
I' the bottom of a cowslip.' [21]

It is very curious, very artificial, and not worth while to analyse at length: I leave it to the reader. But before I turn my back on Shakespeare, I should like to quote a passage, for my own pleasure, and for a very model of every technical art:

'But in the wind and tempest of her frown, W.P.V.[22]F.(st)(ow)
Distinction with a loud and powerful fan, W.P.F.(st)(ow)L
Puffing at all, winnows the light away; W.P.F.L.
And what hath mass and matter by itself W.F.L.M.A.
Lies rich in virtue and unmingled.' [23] V.L.M.

From these delicate and choice writers I turned with some curiosity to a player of the big drum — Macaulay. I had in hand the two-volume edition, and I opened at the beginning of the second volume. Here was what I read: [24]

'The violence of revolutions is generally proportioned to the degree of the maladministration which has produced them. It is therefore not strange that the government of Scotland, having been during many years greatly more corrupt than the government of England, should have fallen with a far heavier ruin. The movement against the last king of the house of Stuart was in England conservative, in Scotland destructive. The English complained not of the law, but of the violation of the law.'

This was plain-sailing enough; it was our old friend PVF, floated by the liquids in a body; but as I read on, and turned the page, and still found PVF with his attendant liquids, I confess my mind misgave me utterly. This could be no trick of Macaulay's; it must be the nature of the English tongue. In a kind of despair, I turned half-way through the volume; and coming upon his lordship dealing with General Cannon, and fresh from Claverhouse and Killiecrankie, here, with elucidative spelling, was my reward: [25]

'Meanwhile the disorders of Kannon's Kamp went on inKreasing. He Kalled a Kouncil of war to Konsider what Kourse it would be advisable to taKe. But as soon as the Kouncil had met, a preliminary Kuestion was raised. The army was almost eKsKlusively a Highland army. The recent viKtory had been won eKsKlusively by Highland warriors. Great chiefs who had brought siKs or seven hundred fighting men into the field did not think it fair that they should be outvoted by gentlemen from Ireland, and from the Low Kountries, who bore indeed King James's Kommission, and were Kalled Kolonels and Kaptains, but who were Kolonels without regiments and Kaptains without Kompanies.'

A moment of FV in all this world of K's! It was not the English language, then, that was an instrument of one string, but Macaulay that was an incomparable dauber.

It was probably from this barbaric love of repeating the same sound, rather than from any design of clearness, that he acquired his irritating habit of repeating words; I say the one rather than the other, because such a trick of the ear is deeper-seated and more original in man than any logical consideration. Few writers, indeed, are probably conscious of the length to

21. *Cymbeline.* [Stevenson's note.] See Act II, Sc.ii, ll.38–39.
22. The V is in 'of.' [Stevenson's note.]
23. *Troilus and Cressida.* [Stevenson's note.] See Act I, Sc.iii, ll.26ff.
24. See Macaulay, *History of England*, ed. 1866, VIII,11.
25. See *ibid.*, VIII,150–51. *Fresh from Claverhouse*, etc.: fresh from writing words and syllables beginning with a *k* sound.

which they push this melody of letters. One, writing very diligently, and only concerned about the meaning of his words and the rhythm of his phrases, was struck into amazement by the eager triumph with which he cancelled one expression to substitute another. Neither changed the sense; both being monosyllables, neither could affect the scansion; and it was only by looking back on what he had already written that the mystery was solved: the second word contained an open A, and for nearly half a page he had been riding that vowel to the death.

In practice, I should add, the ear is not always so exacting; and ordinary writers, in ordinary moments, content themselves with avoiding what is harsh, and here and there, upon a rare occasion, buttressing a phrase, or linking two together, with a patch of assonance or a momentary jingle of alliteration. To understand how constant is this preoccupation of good writers, even where its results are least obtrusive, it is only necessary to turn to the bad. There, indeed, you will find cacophony supreme, the rattle of incongruous consonants only relieved by the jaw-breaking hiatus, and whole phrases not to be articulated by the powers of man.

Conclusion. — We may now briefly enumerate the elements of style. We have, peculiar to the prose writer, the task of keeping his phrases large, rhythmical, and pleasing to the ear, without ever allowing them to fall into the strictly metrical: peculiar to the versifier, the task of combining and contrasting his double, treble, and quadruple pattern, feet and groups, logic and metre — harmonious in diversity: common to both, the task of artfully combining the prime elements of language into phrases that shall be musical in the mouth; the task of weaving their argument into a texture of committed phrases and of rounded periods — but this particularly binding in the case of prose: and, again common to both, the task of choosing apt, explicit, and communicative words. We begin to see now what an intricate affair is any perfect passage; how many faculties, whether of taste or pure reason, must be held upon the stretch to make it; and why, when it is made, it should afford us so complete a pleasure. From the arrangement of according letters, which is altogether arabesque and sensual, up to the architecture of the elegant and pregnant sentence, which is a vigorous act of the pure intellect, there is scarce a faculty in man but has been exercised. We need not wonder, then, if perfect sentences are rare, and perfect pages rarer.

Chronological Outline: 1830–1901

1830

Accession of William IV. — Fall of the Wellington ministry; formation of ministry of Earl Grey. — Opening of the Manchester and Liverpool Railway. — Second French Revolution (July). — Publication of Lyell's *Geology* and Milman's *History of the Jews.*

1831

Reform Bill debated in Parliament, rejected by the House of Lords in its second form, introduced again by Lord John Russell. — Riots follow, and public buildings and the bishop's palace are burned in Bristol.

1832

Reform Bill reconsidered, but defeated by the House of Lords; resignation of the ministry; several days of crisis; Whig ministry resigns; Tories unable to form a ministry; King threatens to create enough peers to pass the Bill; Lord Grey's ministry returns to power. — Reform Bill passed by the House of Lords on June 4, one hundred peers, led by Wellington, withdrawing. — Reform Bill given royal assent on June 7. — General election; the Whigs returned to power. — Death of Bentham.

1833

A year of much remedial legislation: abolition of slavery in the dominions; Irish Church Temporalities Act passed, suppressing two arch-bishoprics and eight bishoprics, and redistributing the revenue; the Factory Act passed. — Keble's Assize Sermon on 'National Apostasy.' — Publication of *Sartor Resartus* begun in *Fraser's Magazine.*

1834

New Poor Law: out-door relief abolished; Poor Law Commission established; the sexes segregated; union of parishes, to pay the rates. — Resignation of Lord Grey; formation of new Whig government, with Lord Melbourne as prime minister (July-November); Conservative ministry begun under Sir Robert Peel. — Committee on Inebriety. — Criminal Law Commission.

1835

Municipal Corporations Act, providing municipal government by popular election. — Resignation of Peel; second Melbourne (Whig) ministry (to 1841).

1836

Marriage Act: validity of civil marriage, and of marriage service performed in a Dissenting chapel. — Tithe Commutation Act: Church tithes, reduced, become annual rent charge (compulsory rates abolished in 1868). — Registration of births, marriages, and deaths transferred from the Church to state officials. — Select Committee on Arts and Manufactures. — Publication of Porter's *Progress of the Nation* and of Pugin's *Contrasts.*

1837

Death of William IV; accession of Victoria. Dissolution of Parliament; General Election; Whig ministry returned with reduced majority. — Publication of Carlyle's *French Revolution.*

1838

Irish Poor Law and Commutation of Tithes. — Publication of *The People's Charter.* — Lord Durham's Report on Canada, urging popular government. —

Organization of the Anti-Corn Law League at Manchester under John Bright, Richard Cobden, and others.

1839

Opium War with China (until 1842). — Penny Postage established (1839–40). — Royal Commission on Police. — First Factory Inspector's Report. — Birmingham riots, Anti-Corn Law agitation, and Socialist activities. — Publication of the *Voyage of the Beagle* (Darwin), and *Chartism* (Carlyle).

1840

Marriage of Queen Victoria and Prince Albert of Saxe-Coburg-Gotha. — New Houses of Parliament begun (the old Houses having been destroyed by fire in 1834).

1841

Fall of Melbourne's ministry; second Peel ministry (to 1846); W. E. Gladstone made vice-president of the Board of Trade. — Factory Committee and Handloom Weavers Committee established — Publication of *Heroes and Hero-Worship*, Newman's *Tract No. 90*, Hugh Miller's *The Old Red Sandstone*. — The founding of *Punch*.

1842

Peel's great budget: first steps toward Free Trade. — Income Tax. — Ashley's Factory Act; prohibiting work in mines by women or by boys under 10; boys between 10 and 13 to work three days a week. — Chartist riots. — Revision of the Corn Laws, reduction of duties on imported foodstuffs, etc. — Chadwick's investigation of the sanitary condition of the laboring population. — Publication of Spencer's *Proper Sphere of Government*.

1843

Anti-Corn Law League very active: 9,000,000 tracts distributed; Cobden, Bright, and others, lecturing and teaching the people political economy. — Disruption of the Church of Scotland. — Newman leaves St. Mary's. — *The Times* becoming a great political power. — Publication of *Past and Present*, Macaulay's *Essays*, Ruskin's *Modern Painters*, *I*, Mill's *Logic*. — Wordsworth made poet laureate.

1844

Bank Charter Act, preventing indefinite increase of paper money, and separating the department of the Bank of England which issued notes, from ordinary banking business. — Royal Commission on Health of Towns. — Metropolitan Improvements Committee. — Children's Factory Act: permitting children to work only half a day or on alternate days, and requiring them to attend school the rest of the time; limiting the hours of women to twelve. — The Rochdale Pioneers, first co-operative society in England, founded. — O'Connell agitates for Irish Home Rule; Young Ireland Party rises. — Publication of *Vestiges of Creation*.

1845

Second Free Trade budget: retaining Income Tax and reducing or abolishing more duties; Disraeli standing for protectionism. — Cobden's great speech convinces Peel; Anti-Corn Law League extremely active, subscriptions mounting to nearly £90,000. — Irish potato blight. — Railway speculation becoming heavy. — Newman converted to Rome. — Publication of Carlyle's *Cromwell*, Newman's *Essay on Development*.

1846

Irish potato famine (1846–47): starvation and emigration reduce the population of Ireland by about one fourth. — Repeal of the Corn Laws: precipitated by the Irish famine, but a victory for Free Trade. — Resignation of Peel; Whig government formed under Lord John Russell as prime minister. — Publication of George Eliot's translation of Strauss' *Leben Jesu*.

847

The Ten-hour Act. — Bank crisis and commercial panic, resulting from the 'railway mania.' — Smithfield (Removal) Committee.

1848

Year of revolutions: Louis Philippe dethroned, and second French Republic established; revolutions in Germany, Austria, Hungary, Italy, Bohemia. — Young Ireland rising. — Collapse of Chartism: huge meeting on Kennington Common; petition presented to parliament; many signatures found to be fictitious; laughter and jeers in parliament. — Pre-Raphaelite Brotherhood founded. — Public Health Act passed. — Fleet Prison demolished. — Publication of Mill's *Political Economy*.

1849

Repeal of the Navigation Acts: further application of Free Trade. — Free Libraries Committee established. — Fall of Hudson, the great 'railway king.' — Annexation of the Punjab (India). — Publication of *The Seven Lamps of Architecture*, Macaulay's *History of England, I, II*, and *The Germ*.

1850

'Papal Aggression': Papal bull establishing Roman Catholic hierarchy in England; Father Wiseman created Cardinal, and Archbishop of Westminster. — Death of Wordsworth; Tennyson made poet laureate. — Publication of Carlyle's *Latter-Day Pamphlets*.

1851

Ecclesiastical Titles Act: imposing heavy penalties on any one attempting to put in effect the papal bull (never executed, repealed in 1871). — The Great Exhibition, under the auspices of Prince Albert, of industries of all nations, the Crystal Palace being the most conspicuous feature. — Louis Napoleon's *coup d'état*. — Publication of Spencer's *Social Statics*, Carlyle's *Life of Sterling*, Ruskin's *Stones of Venice, Pre-Raphaelitism*, Newman's *Present Position of Catholics in England*.

1852

Resignation of Lord John Russell; formation of Conservative ministry, with Lord Derby as prime minister, and Disraeli as Chancellor of the Exchequer. — Death of the Duke of Wellington. — Lord Derby resigns; the Peelites and the Whigs form a coalition ministry under Lord Aberdeen as prime minister, and with Gladstone as Chancellor of the Exchequer. — Drainage and Sewerage of Towns Report. — Cholera Report. — New Houses of Parliament opened. — Newman's *Idea of a University* published.

1853

Gladstone's first budget: Income Tax retained; duties on 124 articles abolished, those on 133 others reduced; legacy duties extended.

1854

Beginning of the Crimean War (ended in 1856). — Drink Traffic Report. — Cholera Report. — Establishment of Working

Men's College. — Publication of Ruskin's *Lectures on Architecture and Painting.*

1855

Resignation of Aberdeen; formation of Whig ministry under Palmerston. — Limited Liability Act. — Adulteration of Food Committee. — Fall of Sebastopol. — Founding of the *Daily Telegraph.* — Publication of Spencer's *Principles of Psychology.*

1856

Peace of Paris, ending the Crimean War. — Annexation of Oudh (India). — Publication of Froude's *History of England, I, II.*

1857

Defeat and return of Palmerston: Bright, Cobden and the 'Manchester School' defeated. — Indian Mutiny (finally put down in 1859). — Divorce Act: providing a special court for use of those not able to afford the expense of securing a divorce by act of parliament. — Bank crisis: Bank Charter Act of 1844 suspended during commercial panic following excessive railway speculation in the United States. — Publication of Buckle's *History, I,* Hugh Miller's *Testimony of the Rocks,* Ruskin's *Political Economy of Art.*

1858

Palmerston resigns; formation of second Derby (Conservative) ministry, with Disraeli as Chancellor of the Exchequer. — Government of India transferred from the East India Company to the Crown. — Jews admitted to Parliament. — Removal of property qualification for membership in the House of Commons. — Publication of part of Carlyle's *Frederick the Great* (finished in 1865), Mansell's *Limits of Religious Thought.*

1859

Derby defeated; formation of second Palmerston ministry, with Gladstone as Chancellor of the Exchequer. — Industrial disorder. — Volunteer movement recognized by government. — Franco-Austrian War. — Death of Macaulay, Leigh Hunt, De Quincey. — Publication of *The Origin of Species,* Mill's *On Liberty.*

1860

Cobdenite Treaty with France, favorable to Free Trade. — Italy, under Garibaldi, fighting for unity and freedom. — Founding of the *Cornhill Magazine.* — Publication of Ruskin's *Unto this Last,* and of *Essays and Reviews.* — Du Maurier's first picture in *Punch.*

1861

Newcastle Commission on Elementary Education. — Revised Code for Elementary Education. — Postal Savings Bank established. — Bankruptcy Bill. — Beginning of the American Civil War: scarcity of cotton brings suffering among Lancashire mill operatives. — Death of Albert, Prince Consort. — Publication of Arnold's *On Translating Homer,* Mill's *Representative Government,* Maine's *Ancient Law,* Spencer's *Education.*

1862

Lancashire Cotton Famine (until 1864). — Colenso controversy. — Second Exhibition of industries of all nations. — Publication of Spencer's *First Principles,* Mill's *Utilitarianism,* Ruskin's *Munera Pulveris* in *Fraser's Magazine.*

1863

Taiping Rebellion. — Publication of Lyell's *Antiquity of Man,* Huxley's *Man's Place in Nature.* — Death of Thackeray and Whately.

1864

Rural Housing Report. — Public Schools Commission (Clarendon). — Synodical condemnation of *Essays and Reviews*. — Publication of Newman's *Apologia*, Spencer's *Principles of Biology*.

1865

Death of Palmerston; Lord John Russell prime minister; Gladstone leader of the House of Commons. — Insurrection in Jamaica put down with great severity by Governor Eyre, who is recalled, and prosecuted by the Jamaica Committee, but not convicted. — Fenian plots in Ireland. — Commons Preservation Society founded: checks enclosures, and later permits selling or renting it in small holdings. — End of American Civil War; Lincoln assassinated. — Publication of Arnold's *Essays in Criticism*, Ruskin's *Sesame and Lilies*, Seeley's *Ecce Homo*, Lecky's *History of Rationalism*. — Founding of the *Fortnightly Review*, and the *Pall Mall Gazette*.

1866

Resignation of Russell after his defeat on a bill to extend the suffrage; third Derby (Conservative) ministry, with Disraeli as Chancellor of the Exchequer. — Hyde Park riots (July); agitation for extension of the suffrage. — Failure of Overend, Guerney and Co., with enormous losses. — Atlantic Cable between England and America declared open on August 4. — Publication of Froude's *History*, Ruskin's *Crown of Wild Olive*. — Founding of the *Contemporary Review*.

1867

Second Reform Bill passed. — Establishment of Royal Commission on Trades Unions. — Dominion of Canada organized. — Fenian rising in Ireland suppressed. — Discovery of diamonds in South Africa. — Publication of Bagehot's *English Constitution*, Froude's *Short Studies, I*, Carlyle's *Shooting Niagara*, Ruskin's *Time and Tide*, Pater's essay on 'Winckelmann,' in *Westminster Review*.

1868

Resignation of Lord Derby; Disraeli prime minister (Feb.-Dec.); resignation of Disraeli on Dec. 2; Gladstone prime minister, Dec. 9. — New Zealand Government Act passed. — Abyssinian campaign. — Prosecution of Governor Eyre. — Publication of Dilke's *Greater Britain*.

1869

Disestablishment of the Irish Church. — Bankruptcy Act revised. — Imprisonment for debt abolished. — Suez Canal opened. — Publication of Arnold's *Culture and Anarchy*, Mill's *On the Subjection of Women*, Ruskin's *Queen of the Air*.

1870

Irish Land Act passed: compensates tenants for removal and for unexhausted improvements, and authorizes loans by the Government to help tenants buy land. — Elementary Education Act: school boards and 'Board Schools' established. — Competitive examinations adopted for Civil Service. — Franco-Prussian War begins. — Fall of Napoleon III; proclamation of the third French Republic. — Unification of Italy under Victor Emmanuel. — Publication of Arnold's *St. Paul and Protestantism*, Huxley's *Lay Sermons and Addresses*, Newman's *Grammar of Assent*, Ruskin's *Lectures on Art*, Spencer's *Principles of Psychology* (recast; *cf.* 1855).

1871

University Tests Act: Dissenters admitted to fellowships in Oxford and Cambridge.

— Abolition of purchase of commissions in army. — Trades Unions recognized legally, but Criminal Law Amendment Act prevents them from taking action. — End of Franco-Prussian War; German Empire created. — Publication of Arnold's *Friendship's Garland*, Darwin's *Descent of Man*, Froude's *Short Studies, II*, Ruskin's *Fors Clavigera* (concluded in 1884).

1872

Ballot Act: introducing the secret ballot. — Cape Colony made self-governing. — Publication of Bagehot's *Physics and Politics*, Ruskin's *Munera Pulveris* from *Fraser's Magazine*.

1873

Judicature Act: reorganizing and consolidating all the courts. — Death of John Stuart Mill. — Publication of Arnold's *Literature and Dogma*, Mill's *Autobiography*, Pater's *Studies in the Renaissance*, Stephen's *Essays on Freethinking and Plain Speaking*.

1874

General Election: second Disraeli ministry. — Public Worship Regulation Act: attempt to put down ritualism. — Home Rule Party formed. — Annexation of Fiji Islands to the British Empire. — Publication of Mill's *Three Essays on Religion*, Morley's *On Compromise*.

1875

Purchase of one-half the shares of the Suez Canal. — Public Health Act: a complicated digest of previous Acts. — Artisans' Dwelling Act: corporations of larger towns enabled to secure houses by compulsory sale to improve sanitary conditions. — Employers and Workmen Act: trade combinations permitted in trade disputes. — Commercial panic. — Death of Lyell. — Publication of Arnold's *God and the Bible*, Carlyle's *Early Kings of Norway*, Ruskin's *Mornings in Florence* (concluded in 1877).

1876

Education Act amended: principle of compulsory education established. - Disraeli created Lord Beaconsfield. — Bulgarian atrocities. — Enclosure of Commons Act: remaining common land preserved for benefit of general community. — Publication of Spencer's *Principles of Sociology* (concluded in 1896).

1877

Queen Victoria proclaimed Empress of India. — Annexation of the Transvaal (Boer) Republic. — Beginning of Russo-Turkish War. — Death of Bagehot. — Publication of Arnold's *Last Essays on Church and Religion*, Froude's *Short Studies, III*.

1878

Factory and Workshops Consolidation Act. — Treaty of Berlin: peace between Turkey and Russia. — Kaffir War (1877-78). — Afghan War (1878-80). Death of Cruikshank, of G. H. Lewes.

1879

Failure of the harvest; severe commercial distress. — Famine in Ireland; Parnell elected President of the National Land League of Ireland. — Kabul taken by Lord Roberts. — Zulu War; Basuto War (1879-81). — Death of W. K. Clifford, of Clerk Maxwell. — Publication of Arnold's *Mixed Essays*, Balfour's *Defence of Philosophic Doubt*.

1880

General Election; second Gladstone ministry. — The Transvaal declares for inde-

pendence. — Employers' Liability Act passed. — Bradlaugh, freethinker, refused permission to take his seat in the House of Commons.

1881

Irish Land Act: granting free sale, fair rents, and fixity of tenure to tenants. — Boers victorious at Majuba Hill. — Rising of the Mahdi in the Sudan. — Death of Disraeli, Carlyle, Stanley. — Publication of Stevenson's *Virginibus Puerisque.*

1882

Fenian murders in Phoenix Park. — British intervention in Egypt. — Death of Darwin, of Pusey. — Publication of Arnold's *Irish Essays and Others.*

1883

Corrupt Practices Act: limiting election expenditures of candidates. — Death of Colenso, of Marx. — Publication of Seeley's *Expansion of England*, Huxley's *Man's Place in Nature.*

1884

Creation of the South African Republic. — War in the Sudan; death of General Gordon at Khartoum (1885). — Royal Commission on Housing the Poor. — Publication of Spencer's *Man versus the State*, Ruskin's *Art of England.* — Third Reform Bill: extension of the suffrage to agricultural workers.

1885

Resignation of Gladstone; formation of Conservative ministry under the Marquis of Salisbury. — Act for Housing the Poor: makes landlords responsible for renting unsound or unsanitary dwellings. — Death of Lord Shaftesbury. — Publication of Arnold's *Discourses in America,* Pater's *Marius the Epicurean,* Ruskin's *Praeterita* (concluded in 1889).

1886

Gladstone's third ministry (Feb.-July). — Home Rule Bill for Ireland introduced and defeated; General Election, Conservative victory; resignation of Gladstone; formation of ministry of Conservatives and Liberal Unionists under Salisbury. — Formation of the Liberal Unionist Party under Lord Hartington and Joseph Chamberlain (against Gladstone's Irish policy). — Publication of Froude's *Oceana,* Maine's *Popular Government.*

1887

Queen's Jubilee, celebrating the fiftieth anniversary of her accession; marked by strong imperialist sentiment. — 'Coercion Act' to check violence in Ireland. — Trafalgar Square riots. — Publication of Pater's *Imaginary Portraits.*

Establishment of County Councils (elected): assuming many of the administrative functions of the justices of the peace. — Accession of Wilhelm II, grandson of Victoria, as Emperor of Germany. — Death of Sir Henry Maine, of Matthew Arnold. — Publication of Arnold's *Essays in Criticism, II*, William Morris' *Signs of Change, Dream of John Ball.*

London Dock Strike: over 75,000 men stopping work to secure higher and less fluctuating wages. — Death of John Bright. — Publication of Pater's *Appreciations.*

1890

Housing of the Working Classes Act: local authorities enabled to raze old buildings

and to erect new ones, and to purchase and improve unsanitary areas. — Report on the 'sweating system' presented to House of Lords; recommendation of 'well considered combinations among the laborers.' — Death of Newman, Dean Church, Chadwick, Liddon. — Publication of Morris' 'News from Nowhere' in *The Commonweal* (published separately in 1891).

1891

Factory Act: giving local authorities the control formerly exercised by factory inspectors over sanitation, and adding further safety requirements. — Free Education Act for England and Wales. — Irish Land Purchase Act: appropriation of £30,000,000 to assist tenants to purchase land.

1892

General Election: Gladstone's fourth ministry; four members of the new Independent Labor party elected. — Irish Agricultural Organization Society founded: furthering co-operative farming, dairying, poultry raising. — Small Holdings Act: assisting tenants and agricultural laborers to buy farms.

1893

Second Home Rule Bill defeated by the House of Lords. — Local Government Act: giving the Irish the same degree of local government as the English. — Death of Jowett, of Tyndall. — Publication of Huxley's *Collected Essays*, Pater's *Plato and Platonism.*

1894

Resignation of Gladstone; Lord Rosebery prime minister. — Harcourt's Death Duties. — Death of Pater, Froude, Stevenson. — Publication of Pater's 'The Child in the House.'

1895

Third Salisbury ministry (coalition of Conservatives and Liberal Unionists. — Jameson's Raid into the Transvaal fails. — Death of Seeley, of Huxley. — Publication of Balfour's *The Foundations of Belief*, Pater's *Greek Studies* and *Miscellaneous Studies.*

1896

Irish Land Purchase Act extended to favor tenants. — Conciliation Act: power given to the Board of Trade to arrange for arbitration in trade disputes. — Death of William Morris. — Publication of Pater's *Gaston de Latour.*

1897

Workmen's Compensation Act passed: amending and extending the Act of 1880. — Second (Diamond) Jubilee. — Third Colonial Conference in London.

1

Kitchener's victory at Omdurman: recovery of the Sudan. — The Fashoda incident with France. — Imperial penny postage established. — Death of Gladstone.

1899

London Government Act: creation of borough councils. — Beginning of the Boer War. — General Federation of Trades Unions formed.

1900

The Boxer Rebellion in China. — Labor Representative Committee formed: enables representatives of Labor to be returned to Parliament. — Death of Ruskin.

1901

Death of Queen Victoria; accession of Edward VII. — Establishment of the Australian Commonwealth. — Publication of Pater's *Essays from The Guardian.*

Growth of Population in England and Wales during the Nineteenth Century

(CENSUS FIGURES)

1801: 8,892,536.
1811: 10,164,256.
1821: 12,000,236.
1831: 13,896,797.
1841: 15,914,148.
1851: 17,927,609.
1861: 20,066,224.
1871: 22,712,266.
1881: 25,974,439.
1891: 29,002,525.
1901: 32,527,843.

MATTHEW ARNOLD (1822–88)

CHRONOLOGY

I. *Early Years, and Education* (1822–45)

1822–33 Born at Laleham on the Thames, Dec. 24, 1822; father, Dr. Thomas Arnold, schoolteacher, and later (1828) Headmaster at Rugby School, a man famous in English education, a stern champion of the moral, the historical, and the ideal and practical; mother, Mary Penrose, daughter of the Rector of Fledborough; godfather was the Rev. John Keble; childhood was quiet, peaceful, and happy; moved to Rugby (1828) when his father became Headmaster; Matthew spent most of the years at Rugby, although, for a time, he returned to Laleham to continue school.

1833–37 Fox How, a valley house in Westmorland, built by Dr. Thomas Arnold with money from the sale of property on the Isle of Wight, became the center for the Arnold family, and Matthew grew up sharing his time between it and Rugby; at Fox How, came into touch with Wordsworth, Hartley Coleridge, Southey; at Rugby, met Clough, Hughes, Stanley; attended Winchester School for a year (1836).

1837–41 Toured France with parents; entered Rugby upon his return in August; won a poetry prize at Rugby (1840) for his 'Alaric at Rome,' his first published poem; won a Balliol Scholarship (1840).

1841–45 Was in France with his brother, Tom, and his father; left home ties for the first time (Oct. 15, 1841) to enter Balliol College, Oxford, then the center of the Tractarian (or Oxford) Movement in which, however, he felt little interest; his greatest friends were Clough and Walrond; became a member of a debating club called The Decade, which included among others: Jowett, Tait, Palgrave, Church, Thomas Arnold, Shairp, Fortesque, Stanley, Clough, Connington, and J.D. Coleridge; won a Hertford Scholarship (1842); father died suddenly (1842); won Newdigate Poetry Prize (1843) with 'Cromwell'; graduated with second class honors (1844).

II. *Poetry, Literary Criticism, Inspection of Schools* (1845–68)

1845–57 Was elected to a Fellowship at Oriel College; taught classics at Rugby, fifth form; became private secretary to the politically active Lord Lansdowne (1847); went to France, and visited George Sand, who had interested him for some time, and Chopin; published *The Strayed Reveller and Other Poems* (1849); appointed to an Inspectorship of Schools by Lord Lansdowne (he held the position until 1886); married Frances Lucy Wightman (June 10, 1851), daughter of Sir William Wightman, judge on the Queen's Bench; served sometimes as Marshal for the Judge at Assizes; married life happy, but nomadic because of demands made upon him by position as Inspector of Schools; was annoyed by his duties, but a strong moral sense made him perform well at all times; published *Empedocles on Etna* (1852), *Poems* (1853), and *Poems, Second Series* (1855).

1857–59 Was elected to the Poetry Chair at Oxford, May 5, 1857 (the first layman to hold it); broke all precedents by giving his lectures in English instead of in Latin; Swinburne, later a friend of Arnold, was among his audience; spent a holiday climbing and

bathing in Switzerland with Theodore Walrond (1858); wrote *Merope* (1858).

1859–61 Was appointed Foreign Assistant Commissioner of the Duke of Newcastle's Commission, the purpose of which was to report upon the state of popular education in England (1859); in Paris, met Mme de Staël, Ernest Renan, Guizot, and Sainte-Beuve; published *England and the Italian Question* (1859), a pamphlet called forth by the Italo-Austrian struggles, politically important enough to attract reviews in journals and a communication from Gladstone; was elected a member of the Alpine Club; returned to London and joined the Queen's Westminster Volunteers, to express his belief in the cultivation of physical, as well as intellectual and financial, superiority by the middle class (1859).

1861–65 Gave a series of Oxford lectures (1861) published under the title *On Translating Homer*; published the report of the commission (1861) under the title, *The Popular Education of France*; re-elected (1862) for a second five-year term as Professor of Poetry at Oxford; published 'The Twice-Revised Code' in *Fraser's Magazine* (1862), and 'A French Eton, or Middle-Class Education and the State' in *Macmillan's Magazine* (Sept., 1863, and Feb. and May, 1864), two important works inspired by the idea of reforming English education; published 'Dante and Beatrice' (1863); attracted increasing attention as a literary man, and, at one dinner, had the pleasure of the company of Browning, Ruskin, Spencer, and Lewes; reviewed Dean Stanley's 'Lectures on the Jewish Church' for *Macmillan's Magazine* (1863); published *Essays in Criticism* (1865), a group of nine critical essays which he had published in periodicals during 1863 and 1864.

1865–68 Appointed Assistant Commissioner on the Schools Inquiry Commission to report upon middle- and upper-class education in France, Germany, Switzerland, and Italy; visited Rome, Florence, Berlin; saw Guizot, Sainte-Beuve, and the Schérers (1865); moved to West Humble, Dorking (1866); published *New Poems* (1867); gave lectures on the study of Celtic literature, published separately in *Cornhill Magazine* (March, April, May, and July, 1866), and as a book (1867).

1868–69 Lost two sons, Basil in January, and Tom in November, buried them at Laleham, and was greatly affected by the loss; published 'Schools and Universities on the Continent' (1868), 'On the Modern Element in Literature' (1869), 'Obermann' (1869), 'Sainte-Beuve' (1869), and, later, 'Higher Schools and Universities in Germany' (1874), as the fruits of his work as Assistant Commissioner and his pleasure as a visitor on the continent; edited his poems for the first collected edition (1869).

III. *Social-Ethical Criticism* (1868–70)

1868–70 Published *Culture and Anarchy* (1869), the popularity of which brought forth a second edition in 1875, in spite of its having appeared already in magazine form in *Cornhill* ('Culture and Its Enemies,' July, 1867, and 'Anarchy and Authority,' Jan., Feb., June, July, and August, 1868), and thus expressed his most famous social-ethical views; expressive of the same doctrines, but epistolary in form and subtly humorous in style, *Friendship's Garland* was published in 1871, a collection of letters to the *Pall-Mall Gazette* from 1866 to 1870, and the essay, 'My Countrymen,' in *Cornhill Magazine* (1866).

IV. *Religious-Ethical Criticism* (1870–78)

1870–78 Paid attention to religious topics for the most part (these years are some-

times unjustly called the years 'in the wilderness' by critics hostile to his religious ideas); published first *St. Paul and Protestantism* in book form (1871), from the separate, earlier essays in *Cornhill Magazine* ('St. Paul and Protestantism' in Oct. and Nov., 1869, and 'Puritanism and the Church of England' in Feb., 1870); took to reading his mother's Bible a great deal, and began learning Hebrew (c. 1871); published two essays in *Cornhill Magazine* in July and October, 1871, and collected and enlarged them in book form as *Literature and Dogma* (1873); seven papers in the *Contemporary Review* under the title, 'A Review of the Objections to Literature and Dogma' (Oct., 1874, to Sept., 1875), he collected into book form, *God and the Bible* (1875); collected in 1877 his last group of religious writings under the title, *Last Essays on Church and Religion* (including periodical publications of the year 1876); friends during the period included Huxley, Browning, Bagehot, Tennyson, and Lady de Rothschild.

V. *Literary Criticism; Social-Ethical Criticism* (1878–88)

1878–83 Wrote literary and social-ethical essays, collecting eight written from 1877 to 1878, along with one written in 1861 ('Popular Education in France,' now revised under the title, 'Democracy') to make up the volume called *Mixed Essays* (1879); traveled to Switzerland for a holiday (1880); published *Irish Essays and Others* (1882) — seven essays written 1879–81, the two prefaces to the editions of his poems, 1853 and 1854, and a newly added Preface.

1883–88 Received, after a little hesitation, but gladly, a pension of £250 a year from Gladstone (1883), and set out immediately upon an American tour (one which proved profitable to him); had difficulty making himself understood by American audiences, even after a few lessons in elocution; in America, met Grant, Carnegie, Whittier, Beecher, Holmes, and others; returned to his home in England (1884); published the American lectures as *Discourses in America* (1885); visited Germany (1885), and met Mommsen and Döllinger; followed Mrs. Arnold to America to see their daughter, Mrs. Lucy Whitridge, and the 'about-to-be-born' granddaughter (1886); returned to England, resigned his Inspectorship (April 30, 1886), and fostered a growing interest in botany (not forsaking literary criticism, and political theorizing, however); collected *Essays in Criticism, Second Series* (1888) from his earlier periodical essays (1877 to 1888), a series famous for some of the best of his prose ('Byron,' 'Milton,' etc.); died of heart failure, on April 15, 1888, in Liverpool, where he had gone to meet his eldest daughter, who was returning from the United States.

COMMENTARY

'Arnold's clearness . . . is felt as an element of technic, and has that quality of density which pleases as a property of a palpable medium. It is pellucid, limpid. One notes it as he does a certain clarity of tone in a painter's technic, a certain explicitness of modelling in a sculptor's touch. It has the air of being not so much instinctive as arrived at. A great deal is done with it. It is elaborately limpid, one may say. It has a tincture of virtuosity. He plays with it beautifully, bringing out into relief certain shadings and subduing certain others in contrasting lower-toned transparencies — as a pianist of distinction not only interprets his composer but exhibits his instrument at the same time. In a word, he makes his lucidity count aesthetically. At times he grows over-fond of it, as is the inherent danger of all exploitation, especially the sincerest; at times it

shows excess and runs into a mannerism of iteration at which in another Arnold himself would be the first to wince. The four times repeated "Scotch drink, Scotch religion, and Scotch manners," within the limits of a single paragraph of his consideration of Burns, is "hard to read without a cry of pain," as he said of a distich of Macaulay. Less formally the remorselessly renewed appearances of "the Bishops of Winchester and Gloucester" in the beginning of "Literature and Dogma" are irritating intrusions. These and similar instances are examples of explicitness run to seed. But they are the defect of a quality, and due to an excess of a dilettante spirit of playfulness to which we owe very much that is acutely charming in Arnold's writings. They are not inherent in his style at its best. At its best in this respect of limpidity a page of his — a page of "Literature and Dogma" itself — reads like a page of the "Apology," in its elaborate and elevated Socratic clearness.

'. . . [His diction] is penetrated with the sentiment of the significance it expresses and never self-hypnotizes. It is too significant to be "musical," but its straightforwardness is very sensitively organized. Its obvious elegance is not the elegance of attachment, but is elegance leavened with personal feeling — now pushed by personal feeling to the point of piquancy, now restrained within the confines of mere suggestion, but informed by it always.

'And for the same reason it is never polished into insipidity. Always full of intention, it is never style for its own sake. One feels that the writer is partial to his style, that he models it consciously and is perfectly aware of it as an element of effectiveness, but it is the dress of too much virility to absorb and preoccupy, however much it may interest, him. It is careful but it is genuine, high-bred but vigorous, studied but simple, considered but considered as form merely. Its urbanity is at times a trifle express — especially in controversy — but it is urbanity associated with too much point ever to be mistaken for approbativeness. It is obviously the style of a writer who adds to their lustre in maintaining the traditions. "Suckled on Latin and weaned on Greek," some one asserted of Dr. Arnold's children, and the classic strain is naturally distinguishable enough in Matthew Arnold's style — in its stuff as well as in its syntax. But it is not in the least academic — it is too modern, too flexible, too much the offspring of English parentage. Its vocabulary is less remarkable for range than for felicity; in felicity it is as remarkable as Tennyson's; indeed with equal aptness — equal *ius tesse* — its felicity is even more marked than Tennyson's, because it is more instinctive, and instinctiveness is a constituent of felicity. Neither is felicity confined to his vocabulary. His phrases are famous.

'This combination of limpidity, beauty and culture, consciously co-operating in the production of an explicit medium, exploited rather than dissembled, has for its notablest result perhaps the circumstance that Arnold's style is, as style, the most interesting of any of the writers of [his] day. I say *as* style, because though I think Thackeray's surpasses it in interest, it does so in the virtue of the inimitable color of a more interesting and omnipresent personality. Thackeray's apart, at all events, there is no other that in respect of interest approaches Arnold's if we take his writings in the mass. His writings taken in the mass gain immensely from their style. Interesting as his substance is, it would be distinctly less so but for the art of its presentation. One has only to think of any of his books written otherwise to feel at once that it would be less captivating. By interest, of course, I mean the feeling that is stimulated by what is admirable, interest within lines of laudability, an artistic interest, in a word — not the thrill aroused by dithyramb, or eccentricity, or picturesqueness, or any of the various forms of

rhetoric which often create an effect whose intensity is altogether disproportionate to its duration. In any theme of Arnold's one is interested in how he takes it, how it is conceived, exhibited, enforced, in the way in which its own intrinsic interest is unfolded, in the adaptation itself of the means to the end. It is not "the grand style." As he says, the grand style is to be found only in poetry, and to my sense he is not a great poet. But he has the style, if not of a great writer, at least of an admirable, a unique, literary artist.' (W.C. Brownell, *Victorian Prose Masters*, New York, 1928, pp. 187-91.)

'To realize the subtle and high quality of Arnold's genius, one has but to compare him with men of science or with rationalists pure and simple, — with men like Professor Huxley, Darwin, or Bentham. Their carefulness for truth, their intellectual strength, their vast services to mankind are acknowledged even by their opponents. Yet Arnold has a far wider range of sensibilities than any one of them; life plays upon him in far richer and more various ways; it touches him into response through associations that have a more distinctively human character, and that have a deeper and a warmer color of emotion drawn out of the past of the race. In short, Arnold brings to bear upon the present a finer spiritual appreciation than the mere man of the world or the mere man of science — a larger accumulation of imaginative experience. Through this temperamental scope and refinement, he is able, while accepting conventional and actual life, to redeem it in some measure from its routine and its commonplace character, and to import into it beauty and meaning and good from beyond the range of science or positive truth. All this comes from the fact that, despite his worldly conformity, he has the romantic ferment in his blood. If his conformity be compared with that of the eighteenth century, — with the worldliness of Swift or Addison, — the enormous value of the romantic increment cannot be missed.

'Finally, Arnold makes of life an art rather than a science, and commits the conduct of it to an exquisite tact, rather than to reason or demonstration. The imaginative assimilation of all the best experience of the past — this he regards as the right training to develop true tact for the discernment of good and evil in all practical matters, where probability must be the guide of life. We are at once reminded of Newman's Illative Sense, which was also an intuitive faculty for the dextrous apprehension of truth through the aid of the feelings and the imagination. But Arnold's new Sense comes much nearer than Newman's to being a genuinely sublimated *Common* Sense. Arnold's own *flair* in matters of art and life was astonishingly keen, and yet he would have been the last to exalt it as unerring. His faith is ultimately in the best instincts of the so-called *remnant* — in the collective sense of the most cultivated, most delicately perceptive, most spiritually-minded people of the world. Through the combined intuitions of such men sincerely aiming at perfection, truth in all that pertains to the conduct of life will be more and more nearly won. Because of this faith of his in sublimated worldly wisdom, Arnold, unlike Newman, is in sympathy with the *Zeitgeist* of a democratic age.

'And indeed here seems to rest Arnold's really most permanent claim to gratitude and honor. He accepts — with some sadness, it is true, and yet genuinely and generously — the modern age, with its scientific bias and its worldly preoccupations; humanist as he is, half-romantic lover of an elder time, he yet masters his regret over what is disappearing and welcomes the present loyally. Believing, however, in the continuity of human experience, and above all in the transcendent worth to mankind of its spiritual acquisitions, won largely through the past domination of Christian ideals, he devotes himself to pre-

serving the quintessence of this ideal life of former generations, and insinuating it into the hearts and imaginations of men of a ruder age. He converts himself into a patient, courageous mediator between the old and the new. Herein he contrasts with Newman on the one hand, and with the modern devotees of æstheticism on the other hand. In the case of Newman, a delicately spiritual temperament, subdued even more deeply than Arnold's to Romanticism, shrunk before the immediacy and apparent anarchy of modern life, and sought to realize its spiritual ideals through the aid of mediæval formulas and a return to mediæval conceptions and standards of truth. Exquisite spirituality was attained, but at the cost of what some have called the Great Refusal. A like imperfect synthesis is characteristic of the followers of art for art's sake. They, too, give up common life as irredeemably crass, as unmalleable, irreducible to terms of the ideal. They turn for consolation to their own dreams, and frame for themselves a House Beautiful, where they may let these dreams have their way, "far from the world's noise," and "life's confederate plea." Arnold, with a temperament perhaps as exacting as either of these other temperaments, takes life as it offers itself and does his best with it. He sees and feels its crudeness and disorderliness; but he has faith in the instincts that civilized men have developed in common, and finds in the working of these instincts the continuous, if irregular, realization of the ideal.' (Lewis E. Gates, ed., *Selections from the Prose Writings of Matthew Arnold*, New York,1898, pp.lxxxiv–lxxxvii.)

NOTES

PREFACE TO THE POEMS, 1853

The Preface to the first edition of Arnold's *Poems* (1853) was reprinted as a separate essay in *Irish Essays and Others* (1882), and followed there by the Preface to the second edition of the *Poems* (1854). In his Preface to the 1882 collection, Arnold wrote: 'The Prefaces which follow at the end were published in 1853 and 1854 as prefaces to my *Poems*, and have not been reprinted since. Some of the readers of my poetry have expressed a wish for their reappearance, and with that wish I here comply. Exactly as they stand, I should not have written them now; but perhaps they are none the worse on that account.' The 'Preface to the Second Edition of Poems (1854)' reads thus:

'I have allowed the Preface to the former edition of these Poems to stand almost without change, because I still believe it to be, in the main, true. I must not, however, be supposed insensible to the force of much that has been alleged against portions of it, or unaware that it contains many things incompletely stated, many things which need limitation. It leaves, too, untouched the question, how far and in what manner the opinions there expressed respecting the choice of subjects apply to lyric poetry, — that region of the poetical field which is chiefly cultivated at present. But neither do I propose at the present time to supply these deficiencies, nor, indeed, would this be the proper place for attempting it. On one or two points alone I wish to offer, in the briefest possible way, some explanation.

'An objection has been warmly urged to the classing together, as subjects equally belonging to a past time, Œdipus and Macbeth. And it is no doubt true that to Shakespeare, standing on the verge of the middle ages, the epoch of Macbeth was more familiar than that of Œdipus. But I was speaking of actions as they presented themselves to us moderns: and it will hardly be said that the European mind, in our day, has much more affinity with the times of Macbeth than with those of Œdipus. As moderns, it seems to me, we have no longer any direct affinity with the circumstances and feelings of either. As individuals, we are attracted towards this or that personage, we have a capacity for imagining him, irrespective of his times, solely according to a law of personal sympathy; and those subjects for which we feel this personal attraction most strongly, we may hope to treat successfully. Prometheus or Joan of Arc, Charlemagne or Agamemnon, — one of these is not really nearer to us now than another. Each can be made present only by an act of poetic imagination; but this man's imagination has an affinity for one of them, and that man's for another.

'It has been said that I wish to limit the poet, in his choice of subjects, to the period of Greek and Roman antiquity;

but it is not so. I only counsel him to choose for his subjects great actions, without regarding to what time they belong. Nor do I deny that the poetic faculty can and does manifest itself in treating the most trifling action, the most hopeless subject. But it is a pity that power should be wasted; and that the poet should be compelled to impart interest and force to his subject, instead of receiving them from it, and thereby doubling his impressiveness. There is, it has been excellently said, an immortal strength in the stories of great actions; the most gifted poet, then, may well be glad to supplement with it that mortal weakness, which, in presence of the vast spectacle of life and the world, he must for ever feel to be his individual portion.

'Again, with respect to the study of the classical writers of antiquity; it has been said that we should emulate rather than imitate them. I make no objection; all I say is, let us study them. They can help to cure us of what is, it seems to me, the great vice of our intellect, manifesting itself in our incredible vagaries in literature, in art, in religion, in morals: namely, that it is *fantastic*, and wants *sanity*. Sanity, — that is, the great virtue of the ancient literature; the want of that is the great defect of the modern, in spite of all its variety and power. It is impossible to read carefully the great ancients, without losing something of our caprice and eccentricity; and to emulate them we must at least read them.'

The Preface of 1853 was Arnold's first appearance as a prose writer, and 'it proclaimed to the discerning, the advent of a new force in criticism and of a new master of prose.' (Hugh Walker, *The Literature of the Victorian Era*, 1910, p.962.) Professor Saintsbury declared this Preface 'the most important critical document issued in England for something like a generation, and which, as prefixed by a poet to his poetry, admits no competitors in English, except some work of Dryden's and some of Wordsworth's' (*Matthew Arnold*, New York,1899, p.33).

Note 17: For a shrewd discussion of Arnold's sometimes inconsistent opinions (*cf.* the selection from *On the Study of Celtic Literature*) of Goethe's *Faust*, see James B.Orrick, *Matthew Arnold and Goethe*, 1928, pp.37–40.

ON TRANSLATING HOMER: LAST WORDS

[THE GRAND STYLE]

In 1860, as Professor of Poetry at Oxford, Arnold commenced a series of three lectures; he wrote: 'I shall try to lay down the true principles on which a translation of Homer should be founded, and I shall give a few passages translated by myself to add practice to theory' (*Letters*, I,145–46). The lectures were published in 1861 under the title *On Translating Homer*. They included much adverse criticism of the translation of the *Iliad* published in 1856 by Francis William Newman (1805–97), scholar and man of letters, professor of classical literature at Manchester New College, 1840–42, and professor of Latin in University College, London, 1842–69. Newman published in 1861 a reply to Arnold (this is reprinted in *Essays Literary and Critical by Matthew Arnold*, in the Everyman's Library Series, pp.276–336). Arnold replied to Newman with an additional lecture, dealing mostly with Newman's arguments; it was published in 1862 as *On Translating Homer: Last Words*, and the present excerpt on 'the grand style' is from it.

Further important indication of Arnold's thoughts on this subject of the grand style is found in the following paragraph, taken from his essay on Maurice de Guérin, published in *Fraser's Magazine*, January, 1863, and in *Essays in Criticism* (1865):

'The grand power of poetry is its interpretative power; by which I mean, not a power of drawing out in black and white

an explanation of the mystery of the universe, but the power of so dealing with things as to awaken in us a wonderfully full, new, and intimate sense of them, and of our relations with them. When this sense is awakened in us, as to objects without us, we feel ourselves to be in contact with the essential nature of those objects, to be no longer bewildered and oppressed by them, but to have their secret, and to be in harmony with them; and this feeling calms and satisfies us as no other can. Poetry, indeed, interprets in another way besides this; but one of its two ways of interpreting, of exercising its highest power, is by awakening this sense in us. I will not now inquire whether this sense is illusive, whether it can be proved not to be illusive, whether it does absolutely make us possess the real nature of things; all I say is, that poetry can awaken it in us, and that to awaken it is one of the highest powers of poetry. The interpretations of science do not give us this intimate sense of objects as the interpretations of poetry give it; they appeal to a limited faculty, and not to the whole man. It is not Linnæus or Cavendish or Cuvier who gives us the true sense of animals, or water, or plants, who seizes their secret for us, who makes us participate in their life; it is Shakespeare, with his

" daffodils
That come before the swallow dares, and take
The winds of March with beauty ";

it is Wordsworth, with his

" voice . . . heard
In spring-time from the cuckoo-bird,
Breaking the silence of the seas
Among the farthest Hebrides ";

it is Keats, with his

" moving waters at their priestlike task
Of cold ablution round Earth's human shores ";

it is Chateaubriand, with his, "*cime indéterminée des forêts*"; it is Senancour, with his mountain birch-tree: "*Cette écorce blanche, lisse et crevassée; cette tige agreste; ces branches qui s'inclinent vers la terre, la mobilité des feuilles, et tout cet abandon, simplicité de la nature, attitude des déserts.*"

'Any one who reads Arnold thoughtfully and thoroughly without feeling an immense quickening of his literary sensibility has, in all probability, no literary sensibility to quicken. The quickening force of the esthetic interest is present to a greater or less degree in everything that Arnold wrote. But it is present with conspicuous and irresistible power in one of the works, which by its title is perhaps a little forbidding to the unprofessional reader — the lectures "On Translating Homer." Readers whom the title deters with the apprehension of something very professional, technical, and pedantic should be assured that, though they may be so unfortunate as to feel no special interest in Homer and absolutely none in translating him, they are likely to find these lectures one of the most instructively delightful of Arnold's works. Occasioned by two recent English translations of the Greek poet, they afford to the relics of savagery in most of us a continuous illicit pleasure in the skilful pitiless flaying of Mr. Francis Newman, the worst of the translators. This performance, it will be acknowledged, exhilarates by no moral appeal — except, perhaps, to a sense that Mr. Newman deserved what was administered to him.

'The destruction of Mr. Wright and Mr. Newman, however, is quite incidental to the main purposes, which are to establish the stylistic qualities of Homer, and, further than that, to establish the idea of the "grand style." Now in establishing his idea of the grand style by his "touchstone" method Arnold sharply challenges us, in the course of a hundred and

fifty vivacious pages, to feel, mark, and compare with him the stylistic qualities in specific lines from: Homer, Newman, Cowper, Pope, Chapman, the romance of Richard Cœur de Lœon, Milton, the Popular Ballads, Shakespeare, the Bible, Doctor Maginn, Scott, Virgil, Dante, Spenser, Tennyson, Horace, Hawtrey, Spedding, Wordsworth and Macaulay. If you compare all these passages as you are directed to compare them, if you make an earnest effort to perceive the stylistic distinctions which Arnold tells you are there, you will find the process highly exciting to your esthetic sensibility; you will undergo an esthetic discipline which you will never forget, and which will leave you with a sense of augmented power in these matters. That you cannot always agree with your guide or feel what he feels is of comparatively little moment. That he has induced in you a sustained effort of feeling and discrimination — there is the precious virtue of his discipline.' (*Matthew Arnold: How to Know Him*, by Stuart P. Sherman, copyright 1917; used by special permission of the Publishers, The Bobbs-Merrill Company, Indianapolis; pp.172–74.)

ESSAYS IN CRITICISM

Sir Arthur Quiller-Couch quoted Herbert W.Paul's statement that *Essays in Criticism* (1865) is Arnold's most important work in prose, the central book, so to speak, of his life, and Saintsbury's judgment of it as 'the first full and varied, and perhaps always the best, expression and illustration of the author's critical attitude, the detailed manifesto and exemplar of the new critical method, and so one of the epoch-making books of the later nineteenth century in English'; then he proceeded: 'Now for a book to be "epoch-making" it must bring to its age something which its age conspicuously lacks: and *Essays in Criticism* did this. No one remembering what Dryden did, and Johnson, and Coleridge, and Lamb, and Hazlitt, will pretend that Arnold invented English Criticism, or that he did well what these men had done ill. What he did, and they missed doing, was to treat Criticism as a deliberate disinterested art, with laws and methods of its own, a proper temper, and certain standards or touchstones of right taste by which the quality of any writing, as literature, could be tested. In other words he introduced authority and, with authority, responsibility, into a business which had hitherto been practised at the best by brilliant nonconformists and at the worst by Quarterly Reviewers, who, taking for their motto *Judex damnatur cum nocens absolvitur*, either forgot or never surmised that to punish the guilty can be but a corollary of a higher obligation — to discover the truth. Nor can any one now read the literature of that period without a sense that Arnold's teaching was indispensably needed just then. A page of Macaulay or of Carlyle dazzles us with its rhetoric; strikes, arrests, excites us with a number of things tellingly put and in ways we had scarcely guessed to be possible; but it no longer convinces. It does not even dispose us to be convinced, since (to put it vulgarly) we feel that the author "is not out after" truth; that Macaulay's William III is a figure dressed up and adjusted to prove Macaulay's thesis, and that the France of Carlyle's *French Revolution* not only never existed but, had it ever existed, would not be France. Arnold helping us, we see these failures — for surely that history is a failure which, like Cremorne, will not bear the daylight — to be inevitable in a republic of letters where laws are not and wherein each author writes at the top of his own bent, indulging and exploiting his personal eccentricity to the fullest. It has probably been the salvation of our literature that in the fourteenth century the Latin prevailed over the Anglo-Saxon line of its descent, and that in the forming of our verse as well as of our prose, we had, at the critical moments,

the literatures of Latin races, Italian or French, for models and correctives; as it was the misfortune of the Victorian period before 1865 that its men of genius wrote with eyes turned inward upon themselves, or, if outward, upon that German literature which, for all its great qualities, must be ever dangerous to Englishmen because it flatters and encourages their special faults.' (Sir Arthur Quiller-Couch, introd. to *The Poems of Matthew Arnold*, Oxford edition, 1913, pp.vii–viii.)

THE FUNCTION OF CRITICISM AT THE PRESENT TIME

This essay was first printed in the *National Review*, November, 1864; in the following year it was reprinted as the first of the collection *Essays in Criticism*, and revised slightly in the 2nd ed. (1869) and the 3rd ed. (1875) of the collection.

Gates wrote of this essay that 'it suggests nearly all the various uses to which he afterward turned criticism: his application of it to social conditions, to science, to philosophy, and to religion, as well as to literature. Properly read, it has also something to say of the causes that gradually led Arnold away from poetry to prose.' (Lewis E. Gates, ed., *Selections from the Prose Writings of Matthew Arnold*, New York, 1898, p.295.)

Note 15: Herbert W. Paul has pointed out 'a strange historical error' into which Arnold fell in citing these words of Burke. See his *Matthew Arnold*, 1902, pp.77–78.

Note 29: Arnold wrote first of Philistinism in his essay on Heine (1863), where he ends the tenth paragraph with urging the use in English of the word 'Philistine.' He is aware of the biblical Philistines, enemies of the children of Israel (*cf. I Samuel*, iv, etc.), and proceeds in the next paragraph:

'*Philistine* must have originally meant, in the mind of those who invented the nickname, a strong, dogged, unenlightened opponent of the chosen people, of the children of the light. The party of change, the would-be remodellers of the old traditional European order, the invokers of reason against custom, the representatives of the modern spirit in every sphere where it is applicable, regarded themselves, with the robust self-confidence natural to reformers as a chosen people, as children of the light. They regarded their adversaries as humdrum people, slaves to routine, enemies to light; stupid and oppressive, but at the same time very strong. This explains the love which Heine, that Paladin of the modern spirit, has for France; it explains the preference which he gives to France over Germany: "The French," he says, "are the chosen people of the new religion, its first gospels and dogmas have been drawn up in their language; Paris is the new Jerusalem, and the Rhine is the Jordan which divides the consecrated land of freedom from the land of the Philistines." He means that the French, as a people, have shown more accessibility to ideas than any other people; that prescription and routine have had less hold upon them than upon any other people; that they have shown most readiness to move and to alter at the bidding (real or supposed) of reason. This explains, too, the detestation which Heine had for the English: "I might settle in England," he says, in his exile, "if it were not that I should find there two things, coal smoke and Englishmen; I cannot abide either." What he hated in the English was the "ächtbrittische Beschränktheit," as he calls it,—the *genuine British narrowness*. In truth, the English, profoundly as they have modified the old Middle-Age order, great as is the liberty which they have secured for themselves, have in all their changes proceeded, to use a familiar expression, by the rule of thumb; what was intolerably inconvenient to them they have suppressed, and as they have suppressed it, not because it was irrational, but because

it was practically inconvenient, they have seldom in suppressing it appealed to reason, but always, if possible, to some precedent, or form, or letter, which served as a convenient instrument for their purpose, and which saved them from the necessity of recurring to general principles. They have thus become, in a certain sense, of all people the most inaccessible to ideas and the most impatient of them; inaccessible to them, because of their want of familiarity with them; and impatient of them because they have got on so well without them, that they despise those who, not having got on as well as themselves, still make a fuss for what they themselves have done so well without. But there has certainly followed from hence, in this country, somewhat of a general depression of pure intelligence: Philistia has come to be thought by us the true Land of Promise, and it is anything but that: the born lover of ideas, the born hater of commonplaces, must feel in this country, that the sky over his head is of brass and iron. The enthusiast for the idea, for reason, values reason, the idea, in and for themselves; he values them, irrespectively of the practical conveniences which their triumph may obtain for him: and the man who regards the possession of these practical conveniences as something sufficient in itself, something which compensates for the absence or surrender of the idea, of reason, is, in his eyes, a Philistine.'

Note 34: Earlier editions read 'one of the party of movement'; the omission of 'of' is probably a typographical error — as suggested by E.K. Brown, in his *Representative Essays of Matthew Arnold*, 1936, p.53.

THE LITERARY INFLUENCE OF ACADEMIES

This essay was first printed in the *Cornhill Magazine*, August, 1864; in the following year it was reprinted in *Essays in Criticism*. For the revisions in this, as in 'The Function of Criticism' and in much of Arnold's prose, see E.K. Brown, *Studies in the Text of Matthew Arnold's Prose Works*, Paris, 1935.

MARCUS AURELIUS

This essay was first printed in the *Victoria Magazine*, November, 1863. The ninth and final essay in *Essays in Criticism* (1865), it became the tenth in the last revised ed. of the *Essays*, the 3rd ed. (1875).

ON THE STUDY OF CELTIC LITERATURE

[SECT. VI]

Arnold, as Professor of Poetry at Oxford, delivered a series of four lectures, in 1865–66, on the study of Celtic literature. They were published in the *Cornhill Magazine*, March, April, May, and July, 1866, and as a book, *On the Study of Celtic Literature*, in 1867.

Arnold remarked in the introduction to the book that the purpose of the lectures was 'not to treat any special branch of scientific Celtic studies (a task for which I am quite incompetent), but to point out the many directions in which the results of those studies offer matter of general interest, and to insist on the benefit we may all derive from knowing the Celt and things Celtic more thoroughly.' This study is part of Arnold's war against Philistinism. Later in the introduction he quoted from his own letter to his Welsh friend Hugh Owen, part of which reads: 'We in England have come to that point when the continued advance and greatness of our nation is threatened by one cause above all. Far more than by the helplessness of an aristocracy whose day is fast coming to an end, far more than by the rawness of a lower class whose day is only just beginning, we are imperilled by what I call the "Philistinism" of our middle class. On the side of beauty and taste, vulgarity; on the side of morals and feeling, coarseness; on the side of mind and spirit, unintelligence, — this is Philistinism. Now, then, is the moment for the

greater delicacy and spirituality of the Celtic peoples who are blended with us, if it be but wisely directed, to make itself prized and honoured.'

In the conclusion to Section IV Arnold stated that he had thus far in his study arrived at a comprehension of 'the Germanic genius, the Celtic genius, the Norman genius. The Germanic genius has steadiness as its main basis, with commonness and humdrum for its defect, fidelity to nature for its excellence. The Celtic genius, sentiment as its main basis, with love of beauty, charm, and spirituality for its excellence, ineffectualness and self-will for its defect. The Norman genius, talent for affairs as its main basis, with strenuousness and clear rapidity for its excellence, hardness and insolence for its defect. And now to try to trace these in the composite English genius.' The next section tries to trace these in the English language, plastic arts, religion, and prose narration; it ends thus: 'It is in our poetry that the Celtic part in us has left its trace clearest, and in our poetry I must follow it before I have done.'

Stuart P. Sherman pointed out that Arnold himself 'openly avows his superficial acquaintance with the monuments of Celtic culture, and frequently reminds his readers that his opinions are conjectural and speculative. He writes as an "essayist" in the older sense of the word; does what he can to convey the impression that he is on a holiday-excursion into a comparatively unmapped and little traveled land.' He proceeded to declare that Arnold's book 'related what was then a neglected and extremely obscure channel of European life to the central political, religious, social and literary interests of the day; and it thus engaged the attention of thousands of cultivated people who had hitherto no notion that the literature of the ancient Celts had any bearing on their concerns. Full of striking generalizations it made conspicuous, if it did not settle, innumerable fascinating linguistic, literary, and ethnological problems; and it thus stimulated many young scholars to enter a field where the harvest was ripe and the reapers few. It helped to prepare the way, on the one hand, for the Anglo-Celtic Renaissance engineered by Mr. Yeats, and, on the other hand, for the foundation of schools of Irish learning and chairs of Celtic in the universities. With results like these, a critic who desires that what he writes may "lead to something" may feel reasonably well satisfied.

'We have given what Arnold would have called an "historic estimate" of the importance of his rather light-hearted excursion among the Celts. If the essay has accomplished its immediate purpose, what value has it now?' And Sherman answered his question by saying that 'one might give many reasons: the charm of its style, its incidental appreciations, its critical digressions, the fact that many of its guesses are as good as any one's guesses, its suggestive comparison of national traits and tendencies, its reprehension of national pride and arrogance, its various persuasions to the study of perfection. The chief reason, however, for still turning to the essay is suggested by its "historical" influence: it was and it is still a vigorous stimulus to *intellectual curiosity*. This virtue abides in it and distinguishes it just as the virtue of a stimulus to *esthetic sensibility* abides in and distinguishes the lectures on Homer.' (*Matthew Arnold: How to Know Him*, by Stuart P. Sherman, copyright 1917; used by special permission of the Publishers, The Bobbs-Merrill Company, Indianapolis; pp.175–77.)

Note 5: A fuller statement of the meaning of *Gemeinheit* appears in the first paragraph of Section IV of *On the Study of Celtic Literature*: '. . . the humdrum, the plain and ugly, the ignoble: in a word *das Gemeine*, *die Gemeinheit*, that curse of Germany, against which Goethe was all his life fighting.' Arnold, too, of course, was fighting against it in England as he fought to promote culture. See also the

essay, 'The Literary Influence of Academies,' n.12.

Note 34: Edwin Guest, in his *A History of English Rhythms*, 1838, Bk. I, Ch. vi, had written: 'I incline therefore to think, though the subject is confessedly one of difficulty, that final rime first originated with the Celtic races, that it was early transferred to the Latin, and from thence came gradually into our own language.' Skeat allowed this to stand uncontroverted when he made a new edition of the book in 1882 (see p.117 of his edition). J. Schipper, in his *A History of English Versification*, 1910, inclines toward another conclusion: 'End-rhyme or full-rhyme seems to have arisen independently and without historical connection in several nations. . . . Its adoption into all modern literature is due to the extensive use made of it in the hymns of the church.'

Note 40: Take the following attempt to render the natural magic supposed to pervade Tieck's poetry: 'In diesen Dichtungen herrscht eine geheimnisvolle Innigkeit, ein sonderbares Einverständniss mit der Natur, besonders mit dem Pflanzen- und Steinreich. Der Leser fühlt sich da wie in einem verzauberten Walde; er hört die unterirdischen Quellen melodisch rauschen; wildfremde Wunderblumen schauen ihn an mit ihren bunten sehnsüchtigen Augen; unsichtbare Lippen küssen seine Wangen mit neckender Zärtlichkeit; ***hohe Pilze***, ***wie goldne*** Glocken, wachsen klingend empor am Fusse der Bäume'; and so on. Now that stroke of the ***hohe Pilze***, the great funguses, would have been impossible to the tact and delicacy of a born lover of nature like the Celt; and could only have come from a German who has ***hineinstudirt*** himself into natural magic. It is a crying false note, which carries us at once out of the world of nature-magic, and the breath of the woods, into the world of theatre-magic and the smell of gas and orange-peel. [Arnold's note.]

Arnold quotes from Heine. *Über Deutschland*, II,ii,2 (*Werke*, Hamburg, 1867, VI,141–42). Johann Ludwig Tieck (1773–1853), German writer, a friend of Novalis, was a leader in the Romantic Movement in German literature. The quotation means: 'In these poems there prevails a mysterious earnestness, a marvelous sympathy with nature, especially with the realm of plants and stones. The reader feels as if he were in a magic forest; he hears the subterranean springs melodiously murmur; wild and strange wonder-flowers gaze at him with their varicolored longing eyes; invisible lips kiss his cheeks with teasing tenderness; high mushrooms, like golden bells, grow upwards, tinkling, at the foot of the trees.' The words '***hineinstudirt*** himself into' mean 'studied himself into,' or, 'by study, brought himself to an artificial mastery of.'

CULTURE AND ANARCHY

'*Culture and Anarchy* (1869) was the first of Arnold's books to illustrate adequately this far-reaching conception of criticism [namely, the vindication of the *ideal* human type against perverting influences]. His special topic is, in this case, social conditions in England. Politicians, he urges, whose profession it is to deal with social questions, are engrossed in practical matters and biassed by party considerations; they lack the detachment and breadth of view to see the questions at issue in their true relations to abstract standards of right and wrong. They mistake means for ends, machinery for the results that machinery is meant to secure; they lose all sense of values and exalt temporary measures into matters of sacred import; finally they come to that pass of ineptitude which Arnold symbolizes by the enthusiasm of Liberals over the measure to enable a man to marry his deceased wife's sister. What is needed to correct these absurd misapprehensions is the free play of critical intelligence. The critic from his secure coign of vantage must examine social conditions dispassionately; he must determine what is essentially

wrong in the inner lives of the various classes of men around him and so reveal the real sources of those social evils which politicians are trying to remedy by external readjustments and temporary measures.

'And this is just the task that Arnold undertakes in *Culture and Anarchy*.' (Lewis E. Gates, ed., *Selections from the Prose Writings of Matthew Arnold*, New York, 1898, pp.xxiii–xxiv.)

PREFACE

Arnold's *Culture and Anarchy* was composed of six articles that had been printed in the *Cornhill Magazine*, together with a preface and a conclusion. The first article, which had borne the title 'Culture and Its Enemies' (*Cornhill*, July, 1867), he made into the brief 'Introduction' and Chapter I, entitled 'Sweetness and Light.' The other five articles (*Cornhill*, Jan., Feb., June, July, Aug., 1868) had borne the title 'Anarchy and Authority'; they became chapters II–VI. In the present volume are reprinted the Preface (written after the appearance of the six articles), the Introduction, and the first four chapters. The title *Culture and Anarchy* takes a word from each of the two titles used in the *Cornhill Magazine*. The 2nd edition (1875) carried various additions and omissions, and the 3rd, or 'popular' edition (1882) follows it. On the back of the title-page, and immediately preceding the beginning of the Preface, is printed this quotation from the Vulgate: '*Estote ergo vos perfecti!*' *Cf. Matthew*, v,48: 'Be ye therefore perfect.'

Note 26: John Bright (1811–89), orator and statesman; many years a member of Parliament, repeatedly a member for Birmingham. As a boy he worked in his father's mill. He and Richard Cobden 'were the two leading representatives of the emergence of the manufacturing class as a force in English politics after the Reform Act of 1832' (D.N.B.). Arnold frequently attacks him as a 'Philistine.' In 1869 he was a member of Gladstone's cabinet, the first nonconformist to be a cabinet member. Volumes of his speeches appeared in 1868 and 1879. The historian G.M.Trevelyan has written his biography.

Bright's speech 'On Assistance by Government to Technical Education,' delivered Feb. 5, 1868, contained words as follows: 'I believe the people of the United States have offered to the world more valuable inventions during the last forty years than all Europe put together.' See his *Public Addresses*, ed. Thorold Rogers, 1879, p.62. J. Dover Wilson, in his edition of *Culture and Anarchy*, p.217, points out that 'Arnold is here unfair in that he misquotes (no doubt quite unconsciously) Bright's words'; for Bright's use of 'inventions' (not 'information') destroys the point of Arnold's argument.

INTRODUCTION

See the notes on the Preface. 'Culture and Its Enemies,' in its original form, 'was delivered as Mr. Arnold's last lecture in the Poetry Chair at Oxford' in May, 1867. (See the *Cornhill Magazine*, July, 1867, p.36.)

CHAPTER I: SWEETNESS AND LIGHT

Note 14: Jonathan Swift's *The Battle of the Books* appeared first in 1704. From it Arnold derived the title phrase 'sweetness and light' (*cf.* Swift's *Works*, ed. 1868, pp.102–03); and it provides also a parallel, in the distinction between the Bee and the Spider, to Arnold's distinction between the man of culture and the Philistine. The Spider boasts of his web: 'I am a domestic animal, furnished with a native stock within myself. This large castle (to show my improvements in the mathematics) is all built with my own hands, and the materials extracted altogether out of my own person.' The Bee then raises the question: 'Whether is the nobler being of the two: that which by a lazy contemplation of four inches round, by an overweening pride, feeding and engendering on itself, turns all into excrement and venom, producing nothing but flybane and cobweb; or that

which by a universal range, with long search, much study, true judgment and distinction of things, brings home honey and wax?' Swift has the Spider represent the modern writers; and the Bee represent the ancient, who 'by infinite labour and search, and ranging through every corner of nature' have filled their 'hives with honey and wax; thus furnishing mankind with the two noblest of things, which are sweetness and light.' The figure of speech was particularly apt and intelligible in the days of wax candles.

CHAPTER II: DOING AS ONE LIKES

Note 9: Gladstone proposed a reform bill in 1866 to reduce the property qualifications for voting, and so to extend the voting power to the poorer people. It was defeated. Thereafter, demonstrations were held in many cities, and some riots broke out. In July, 1866, a large body known as the Reform League, led by the lawyer Edmond Beales, the politician Charles Bradlaugh (who had a great following among the working classes), Colonel Dickson, and G.J.Holyoake (author, and editor of economically and politically radical publications), marched through London streets to hold a mass meeting in Hyde Park. Middle-class Londoners, accustomed to using the Park as a pleasure-garden for their families, were alarmed. The gates of the Park were closed, by order of the Government. The leaders of the procession requested entrance, then withdrew their group for a meeting in Trafalgar Square. But an immense crowd of people had gathered at Hyde Park, and rough elements in it tore down the Park railings, and trampled the flower-gardens. For several days the disorderliness of the Hyde Park Riots continued.

A few weeks earlier a certain Alderman Samuel Wilson, colonel of a regiment of London militia, had marched his regiment to Hyde Park. Crowds followed, and many ruffians knocked hats off, and 'robbed and beat the bystanders,' and the Alderman-Colonel refused to let his troops interfere. He explained in defense that he was afraid the mob might have taken the rifles away from his men, and used them against the soldiery. (*Cf.* Arnold's account later in this essay. See J. Dover Wilson's ed. of *Culture and Anarchy*, pp.ix–x, for a defense of the colonel.)

Note 9a: Fenians, revolutionary Irishmen, made violent outbreaks in several parts of England in 1867; for instance, Fenians tried to capture arms and ammunition at Chester Castle, Fenians rescued two men who had been arrested in Manchester and shot the sergeant in charge, and later, in London, Fenians blew up the walls of Clerkenwell jail in an attempt to rescue prisoners, and killed or injured many people nearby.

Many Englishmen sympathized with the Irish arrested for the murder at Manchester, some of whom must have been innocent. A group of such Englishmen 'invaded' by force the office of the Home Secretary in their behalf. The Secretary then was Mr. Gathorne-Hardy (1814–1906), who became Earl of Cranbrook.

Note 10: In 1867 and 1868, an anti-Roman Catholic lecturer named Murphy stirred up much bitter feeling. Arnold quotes from his speeches and those of his supporter, the Dissenting minister from Walsall (see the passage with n.41). Murphy declared he would give a series of lectures in Birmingham on 'The Errors of the Roman Church,' asked the mayor for the use of the town hall, but was refused. With the help of Protestant friends, he had a great 'tabernacle' built, seating 3,000 people. His speeches caused public riots that got beyond police control. And in the next year (1868) Murphy spoke in Ashton-under-Lyne and in Manchester, and caused further bloody violence. (See *Culture and Anarchy*, ed. J. Dover Wilson, p.xxix.)

Note 23: For 'a well-known lord and a well-known baronet' the 1st ed. of *Cul-*

ture and Anarchy reads 'Lord Elcho and Sir Thomas Bateson.' Lord Elcho (1818–1914) in 1883 succeeded his father as Earl of Wemyss and March; he was a Conservative politician, member of Parliament, 1841–83. Sir Thomas Bateson was in 1865 a member of Parliament; his speech here referred to was delivered June 4, 1867. (Arnold quotes it later — see 'Barbarians,' etc., n.43.)

CHAPTER III: BARBARIANS, PHILISTINES, POPULACE

Note 10: As the last paragraph of the Preface to *Essays in Criticism* (1865) Arnold wrote of Philistinism and Oxford. Here is a glorious tribute from an alumnus to his university. It has been called Arnold's finest prose:

'And yet, after all, I cannot but think that the *Saturday Review* has here, for once, fallen a victim to an idea, — a beautiful but deluding idea, — and that the British nation has not yet, so entirely as the reviewer seems to imagine, found the last word of its philosophy. No, we are all seekers still! seekers often make mistakes, and I wish mine to redound to my own discredit only, and not to touch Oxford. Beautiful city! so venerable, so lovely, so unravaged by the fierce intellectual life of our century, so serene!

"There are our young barbarians, all at play!"

And yet, steeped in sentiment as she lies, spreading her gardens to the moonlight, and whispering from her towers the last enchantments of the Middle Age, who will deny that Oxford, by her ineffable charm, keeps ever calling us nearer to the true goal of all of us, to the ideal, to perfection, — to beauty, in a word, which is only truth seen from another side? — nearer, perhaps, than all the science of Tübingen. Adorable dreamer, whose heart has been so romantic! who hast given thyself so prodigally, given thyself to sides and to heroes not mine, only never to the Philistines! home of lost causes, and forsaken beliefs, and unpopular names, and impossible loyalties! what example could ever so inspire us to keep down the Philistine in ourselves, what teacher could ever so save us from that bondage to which we are all prone, that bondage which Goethe, in his incomparable lines on the death of Schiller, makes it his friend's highest praise (and nobly did Schiller deserve the praise) to have left miles out of sight behind him; — the bondage of "*was uns alle bändigt, DAS GEMEINE*"! She will forgive me, even if I have unwittingly drawn upon her a shot or two aimed at her unworthy son; for she is generous, and the cause in which I fight is, after all, hers. Apparitions of a day, what is our puny warfare against the Philistines, compared with the warfare which this queen of romance has been waging against them for centuries, and will wage after we are gone?'

Note 14: Swinburne wrote the following in discussing Wordsworth's influence upon Arnold (in 'Mr. Arnold's New Poems,' *Fortnightly Review*, Oct., 1867, VIII,425): 'It will be a curious problem for the critics of another age to work at, and, if they can, to work out, this influence of men more or less imbued with the savour and spirit of Philistia upon the moral Samson who has played for our behoof the part of Agonistes or protagonist in the new Gaza where we live. From the son of his father and the pupil of his teacher [Wordsworth] none would have looked for such efficient assault and battery of the Philistine outworks. . . . A profane alien in my hearing once defined him as "David, the son of Goliath."'

CHAPTER IV: HEBRAISM AND HELLENISM

The words *Hellenism* and *Hebraism* probably were derived by Arnold from Heinrich Heine's *Über Ludwig Börne*, 1840 (see his *Werke*, ed. Philadelphia,

1857, VI,466): '"Jew" and "Christian" are for me words of quite similar meaning and are both opposed to Hellene, by which name also I denote no special nation, but a mental habit and a mode of conceiving life, which are both innate and the result of training. In this connection I might say: All men are either Jews or Hellenes, men ascetic in their instincts, hostile to culture, spiritual fanatics, or men of vigorous good cheer, full of the pride of life, Naturalists. Thus there have been Hellenes in the families of German pastors, and there have been Jews who were born in Athens and perhaps the direct descendants of Theseus. The beard makes not the Jew, nor the peruke the Christian.'

Note 42: In Chapter V ('Porro Unum Est Necessarium') of *Culture and Anarchy* Arnold points out in two noteworthy paragraphs the danger of Puritanism:

'Well, then, what is the good of our now rehearsing the praises of fire and strength to ourselves, who dwell too exclusively on them already? When Mr. Sidgwick says so broadly, that the world wants fire and strength even more than sweetness and light, is he not carried away by a turn for broad generalisation? does he not forget that the world is not all of one piece, and every piece with the same needs at the same time? It may be true that the Roman world at the beginning of our era, or Leo the Tenth's Court at the time of the Reformation, or French society in the eighteenth century, needed fire and strength even more than sweetness and light. But can it be said that the Barbarians who overran the empire needed fire and strength even more than sweetness and light; or that the Puritans needed them more; or that Mr. Murphy, the Birmingham lecturer, and his friends, need them more?

'The Puritan's great danger is that he imagines himself in possession of a rule telling him the *unum necessarium*, or one thing needful, and that he then remains satisfied with a very crude conception of what this rule really is and what it tells him, thinks he has now knowledge and henceforth needs only to act, and, in this dangerous state of assurance and self-satisfaction, proceeds to give full swing to a number of the instincts of his ordinary self. Some of the instincts of his ordinary self he has, by the help of his rule of life, conquered; but others which he has not conquered by this help he is so far from perceiving to need subjugation, and to be instincts of an inferior self, that he even fancies it to be his right and duty, in virtue of having conquered a limited part of himself, to give unchecked swing to the remainder. He is, I say, a victim of Hebraism, of the tendency to cultivate strictness of conscience rather than spontaneity of consciousness. And what he wants is a larger conception of human nature, showing him the number of other points at which his nature must come to its best, besides the points which he himself knows and thinks of. There is no *unum necessarium*, or one thing needful, which can free human nature from the obligation of trying to come to its best at all these points. The real *unum necessarium* for us is to come to our best at all points. Instead of our "one thing needful," justifying in us vulgarity, hideousness, ignorance, violence, — our vulgarity, hideousness, ignorance, violence, are really so many touchstones which try our one thing needful, and which prove that in the state, at any rate, in which we ourselves have it, it is not all we want. And as the force which encourages us to stand staunch and fast by the rule and ground we have is Hebraism, so the force which encourages us to go back upon this rule, and to try the very ground on which we appear to stand, is Hellenism, — a turn for giving our consciousness free play and enlarging its range. And what I say is,

not that Hellenism is always for everybody more wanted than Hebraism, but that for Mr. Murphy at this particular moment, and for the great majority of us his fellow-countrymen, it is more wanted.'

LITERATURE AND DOGMA

CHAPTER XII: THE TRUE GREATNESS OF CHRISTIANITY

Published in 1873, *Literature and Dogma: An Essay towards a Better Apprehension of the Bible* went through three editions in the first month after publication. Arnold wrote in Sect.I of the Introduction to *God and the Bible* (1875) that he himself had a firm conviction of 'the indispensableness of the Bible,' and stated what his purpose had been in writing *Literature and Dogma*: 'It was written in order to win access for the Bible and its religion to many of those who now neglect them. It was written to restore the use of the Bible to those (and they are an increasing number) whom the popular theology with its proofs from miracles, and the learned theology with its proof from metaphysics, so dissatisfy and repel that they are tempted to throw aside the Bible altogether. It was written to convince such persons that they cannot do without the Bible, that the popular theology and the learned theology are alike formed upon a profound misapprehension of the Bible; but that, when the Bible is read aright, it will be found to deal, in a way incomparable for effectiveness, with facts of experience most pressing, momentous, and real.'

The work shows Arnold rejecting the supernatural, the miraculous, in religion; yet it is deeply religious in tone and purpose. 'Rejected as pure Atheism by some, "Literature and Dogma" has been a light in darkness to others. It has led them through a wholesome criticism towards the possibilities of a new working conception of Christianity. Stirring the keenest resentment on the one hand, it has on the other hand won the admiration of many younger minds. . . . From the literary point of view "Literature and Dogma" by its unerring selections of scripture, its varied vocabulary, its satire, and its approbation of orthodox witness, is rich in beauty.' (Charles H.Harvey, *Matthew Arnold: A Critic of the Victorian Period*, 1931, pp.245,246 47.) Augustine Birrell insisted that it must be called 'a most valuable and useful book, and one to which the professional critics and philosophers never did justice.' Its object, he said, was 'no less than the restoration of the use of the Bible to the sceptical laity. It was a noble object, and it was in a great measure, as thousands of quiet people could testify, attained.' (*Res Judicatae*, New York,1892, p.203.)

Note 33: In the King James version, *John*, v.25 reads as follows. '. . . The hour is coming, and now is, when the dead shall hear the voice of the Son of God: and they that hear shall live.' Arnold has made one omission and one rephrasing, although he retains the meaning of the King James version. This is typical of what the reader must be prepared to expect in Arnold's quotations from the Bible, if he uses the King James version in verifying the sources given in the footnotes.

CONCLUSION

The second and final section of the Conclusion contains but six paragraphs, and is rather an anti-climax following the section reprinted here. It is of interest, however, to all students of Arnold's ironic humor, and use of personalities.

Note 4: This is the reading of the fifth, the standard, edition (1875). Earlier editions read: 'Of our hymns we here say nothing.' In the popular edition (1883) the clause is omitted. The second and final section of this Conclusion (see note above) contains the following: '. . . God is displeased and disserved by many things which cannot be said except by

putting strain upon words. . . . He is displeased and disserved by men uttering such doggerel hymns as: *Sing glory, glory, glory to the great God Triune!* and: *Out of my stony griefs Bethels I'll raise!* and: *My Jesus to know, and feel his blood flow, 'tis life everlasting, 'tis heaven below!* or by theologians uttering such pseudo-science as their *blessed truth that the God of the universe is a PERSON.*'

GOD AND THE BIBLE

Numerous critical articles attacked Arnold's *Literature and Dogma*. He published seven articles, under the title 'A Review of Objections to *Literature and Dogma*,' in the *Contemporary Review*, Oct., 1874-Sept., 1875. These, together with the Preface here reprinted, were published in book form in 1875 as *God and the Bible: A Review of Objections to 'Literature and Dogma.'* In the Introduction, Sect.I, Arnold points out that in this, as in the earlier book, he wishes to impart to others his 'conviction of the indispensableness of the Bible.' He asserts that 'Nothing but righteousness will succeed, and nothing is righteousness but the method and secret and sweet reasonableness of Jesus Christ.' He states further: 'It seemed to us that the great danger to the Bible at present arises from the assumption that whoever receives the Bible must set out with admitting certain propositions, such as the existence of a personal God, the consubstantiality of Jesus Christ with this personal God who is his Father, the miraculous birth, resurrection, and ascension of Jesus. Now, the nature of these propositions is such that we cannot possibly verify them. It seemed to us that with the uninstructed or ill-instructed masses of our people this obstacle to the Bible's reception, which for a long time was an obstacle not existent for them at all, is as things now stand, an obstacle almost insuperable. Therefore we sought and seek to show that the Bible is really based upon propositions which all can verify.'

The first five paragraphs of the Preface are omitted in the present reprinting. They treat rather technically of the faults and merits of biblical criticism by German critics, especially Ferdinand Christian Baur. Arnold himself properly sets them off by a double space.

In a letter to Charles Eliot Norton, Arnold wrote of this book: 'I seem to find some chapters in it to be the best prose I have ever succeeded in writing' (*Letters*, ed. Russell, II,268).

Arnold was a steady friend to the Christian religion, however critical of it he was. Stuart P. Sherman properly comments, further, that 'one can not see Arnold whole unless one knows well *St. Paul and Protestantism*, *Literature and Dogma*, and *God and the Bible*; to neglect these books is to miss some of his best writing, some of his most penetrating and permanently valuable literary criticism, some of the central aspects of his character, and an integral part of his effort to civilize the world.' (Sherman, *op.cit.*, p.272.)

IRISH ESSAYS

A SPEECH AT ETON

Arnold delivered an address to the Eton Literary Society, and published it in the *Cornhill Magazine*, May, 1879, as 'A Speech at Eton.' H.W.Paul says that this lecture to the boys of Eton is 'oddly' included in the collection called *Irish Essays*, in 1882. It shows Arnold amplifying, by a vivid if somewhat belabored illustration, his principle of culture for all, in all the four phases of culture; and the value of a carefully achieved education in the classics as an unsurpassable type of education leading toward culture. Rather acrid irony appears in his references to 'the diameter of the sun and moon,' and 'a great many scientific lectures.' The lecture is important, according to Paul,

because of 'its fruitful and suggestive comparison of Greek life with English.' (H.W.Paul, *Matthew Arnold*, New York, 1925, p.164.)

DISCOURSES IN AMERICA

'But, after all, Politics, in the technical sense, did not afford a suitable field for his peculiar gifts. It was when he came to the criticism of national life that the hand of the master was felt. In all questions affecting national character and tendency, the development of civilization, public manners, morals, habits, idiosyncracies, the influence of institutions, of education, of literature, his insight was penetrating, his point of view perfectly original, and his judgment, if not always sound, invariably suggestive. These qualities, among others, gave to such books as *Essays in Criticism*, *Friendship's Garland*, and *Culture and Anarchy*, an interest and a value quite independent of their literary merit. And they are displayed in their most serious and deliberate form, dissociated from all mere fun and vivacity, in his *Discourses in America*. This, he told the present writer, was the book by which, of all his prose-writings, he most desired to be remembered. It was a curious and memorable choice.' (G.W.E.Russell, *Matthew Arnold*, New York,1904, p.12.)

LITERATURE AND SCIENCE

'The "Literature and Science" is delightful, a real *vade mecum* for the humanist,' wrote W.C.Brownell (*Victorian Prose Masters*, 1928, p.174). This essay was first delivered by Arnold as the Rede Lecture at Cambridge University in England. It was published in the *Nineteenth Century*, August, 1882; he revised it considerably, taking out the allusions to Cambridge and inserting references to the United States; and delivered it as a lecture during his American tour of 1883–84. In 1885 he published it and two other lectures delivered in America ('Numbers; or the Majority and the Remnant' — first printed in the *Nineteenth Century*, April, 1884 — and 'Emerson') in the volume *Discourses in America*. The present reprint is from the *Discourses*.

A comparison of the revised version with the original, the Rede Lecture, is valuable. Here are the opening five paragraphs of the Rede Lecture:

'*No wisdom, nor counsel, nor understanding, against the Eternal!* says the Wise Man. Against the natural and appointed course of things there is no contending. Ten years ago I remarked on the gloomy prospect for letters in this country, inasmuch as while the aristocratic class, according to a famous dictum of Lord Beaconsfield, was totally indifferent to letters, the friends of physical science on the other hand, a growing and popular body, were in active revolt against them. To deprive letters of the too great place they had hitherto filled in men's estimation, and to substitute other studies for them, was now the object, I observed, of a sort of crusade with the friends of physical science, — a busy host important in itself, important because of the gifted leaders who march at its head, important from its strong and increasing hold upon public favour.

'I could not help, I then went on to say, I could not help being moved with a desire to plead with the friends of physical science on behalf of letters, and in deprecation of the slight which they put upon them. But from giving effect to this desire I was at that time drawn off by more pressing matters. Ten years have passed, and the prospects of any pleader for letters have certainly not mended. If the friends of physical science were in the morning sunshine of popular favour even then, they stand now in its meridian radiance. Sir Josiah Mason founds a college at Birmingham to exclude "mere literary instruction and education"; and at its opening a brilliant and charming debater, Professor Huxley, is brought down to pronounce their funeral oration. Mr. Bright,

in his zeal for the United States, exhorts young people to drink deep of "Hiawatha"; and the *Times*, which takes the gloomiest view possible of the future of letters, and thinks that a hundred years hence there will only be a few eccentrics reading letters and almost every one will be studying the natural sciences — the *Times*, instead of counselling Mr. Bright's young people rather to drink deep of Homer, is for giving them, above all, "the works of Darwin and Lyell and Bell and Huxley," and for nourishing them upon the voyage of the "Challenger." Stranger still, a brilliant man of letters in France, M. Renan, assigns the same date of a hundred years hence, as the date by which the historical and critical studies, in which his life has been passed and his reputation made, will have fallen into neglect, and deservedly so fallen. It is the regret of his life, M. Renan tells us, that he did not himself originally pursue the natural sciences, in which he might have forestalled Darwin in his discoveries.

'What does it avail, in presence of all this, that we find one of your own prophets, Bishop Thirlwall, telling his brother who was sending a son to be educated abroad that he might be out of the way of Latin and Greek: "I do not think that the most perfect knowledge of every language now spoken under the sun could compensate for the want of them"? What does it avail, even, that an august lover of science, the great Goethe, should have said: "I wish all success to those who are for preserving to the literature of Greece and Rome its predominant place in education"? Goethe was a wise man, but the irresistible current of things was not then manifest as it is now. *No wisdom, nor counsel, nor understanding, against the Eternal!*

'But to resign oneself too passively to supposed designs of the Eternal is fatalism. Perhaps they are not really designs of the Eternal at all, but designs — let us for example say — of Mr. Herbert Spencer. Still the design of abasing what is called "mere literary instruction and education," and of exalting what is called "sound, extensive, and practical scientific knowledge," is a very positive design and makes great progress. The Universities are by no means outside its scope. At the recent congress in Sheffield of elementary teachers — a very able and important body of men whose movements I naturally follow with strong interest — at Sheffield one of the principal speakers proposed that the elementary teachers and the Universities should come together on the common ground of natural science. On the ground of the dead languages, he said, they could not possibly come together; but if the Universities would take natural science for their chosen and chief ground instead, they easily might. Mahomet was to go to the mountain, as there was no chance of the mountain's being able to go to Mahomet.

'The Vice-Chancellor has done me the honour to invite me to address you here to-day, although I am not a member of this great University. Your liberally conceived use of Sir Robert Rede's lecture leaves you free in the choice of a person to deliver the lecture founded by him, and on the present occasion the Vice-Chancellor has gone for a lecturer to the sister University. I will venture to say that to an honour of this kind from the University of Cambridge no one on earth can be so sensible as a member of the University of Oxford. The two Universities are unlike anything else in the world, and they are very like one another. Neither of them is inclined to go hastily into raptures over her own living offspring or over her sister's; each of them is peculiarly sensitive to the good opinion of the other. Nevertheless they have their points of dissimilarity. One such point, in particular, cannot fail to arrest notice. Both Universities have told powerfully upon the mind and life of the nation. But the University of Oxford, of which I am a member, and to

which I am deeply and affectionately attached, has produced great men, indeed, but has above all been the source or the centre of great movements. We will not now go back to the middle ages; we will keep within the range of what is called modern history. Within this range, we have the great movements of Royalism, Wesleyanism, Tractarianism, Ritualism, all of them having their source or their centre in Oxford. You have nothing of the kind. The movement taking its name from Charles Simeon is far, far less considerable than the movement taking its name from John Wesley. The movement attempted by the Latitude men in the seventeenth century is next to nothing as a movement; the men are everything. And this is, in truth, your great, your surpassing distinction: not your movements, but your men. From Bacon to Byron, what a splendid roll of great names you can point to! We, at Oxford, can show nothing equal to it. Yours is the University not of great movements, but of great men. Our experience at Oxford disposes us, perhaps, to treat movements, whether our own, or extraneous movements such as the present movement for revolutionising education, with too much respect. That disposition finds a corrective here. Masses make movements, individualities explode them. On mankind in the mass, a movement, once started, is apt to impose itself by routine; it is through the insight, the independence, the self-confidence of powerful single minds that its yoke is shaken off. In this University of great names, whoever wishes not to be demoralised by a movement comes into the right air for being stimulated to pluck up his courage and to examine what stuff movements are really made of.'

These paragraphs were replaced by the opening six paragraphs in the present version. Beginning with the statement 'I am going to ask whether the present movement,' the two versions are essentially alike.

ESSAYS IN CRITICISM, SECOND SERIES

Discussing Arnold's accomplishment and position as a critic, Saintsbury wrote that a great critic must be a master of self-expression and of promoting in his readers the intelligent appreciation and the conscious enjoyment of literature. 'Few critics,' he continued, 'can meet this question more triumphantly than Mr. Arnold. Like others, he can but give what he has. If you ask him for a clear, complete, resumed and reasoned grasp of a man's accomplishment — for a definite placing of him in the literary atlas — he will not have much answer to give you. He does not pretend, and has never pretended, to give any . . .' But 'for acute, sensitive, inspired, and inspiring *remarks* on the man, or the work, or this and that part of work and man — attractively expressed, ingeniously co-ordinated, and redeemed from mere desultoriness by the constant presence of the general critical creed — no critic is his superior.' Saintsbury called Arnold the first English critic who systematically and impartially urged 'the importance, the necessity, of that comparative criticism of different literatures, the half-blind working of which had helped to create, if it had not actually created, the Romantic movement.' And he added that Arnold is notable moreover for his caution 'against confounding literary and non-literary art. No one rejected the exaggeration of "Art for Art's sake *only*" more unhesitatingly; but no one oftener repeated the caution against letting the idols of the nation, the sect, the party interfere with the free play of Art herself, and of critical judgment on Art.

'His services, therefore, to English Criticism, whether as a "preceptist" or as an actual craftsman, cannot possibly be overestimated.' (George Saintsbury, *A History of English Criticism*, 1904, III. 534–36.)

The collection of the essays in this vol-

ume was 'made by Mr. Arnold himself,' but he had not written a preface for the volume when death took him in 1888. 'The Study of Poetry' had appeared first in 1880 as the general introduction to a series of volumes of poetry edited by T.H. Ward, entitled *The English Poets*. 'Wordsworth' had appeared first as the introduction to a selection, *Poems of Wordsworth* (1879), made by Arnold himself. 'Byron,' first printed in *Macmillan's Magazine*, March, 1881, had appeared as the introduction to a selection, *Poetry of Byron* (1881), also made by Arnold.

'The Study of Poetry' is a consideration of the service rendered by poetry and the standards for judging it. This essay Professor Elton called 'a confession of faith,' and declared that 'it did more than anything else to spread Matthew Arnold's ideas broadcast.' (Oliver Elton, *A Survey of English Literature, 1780–1880*, New York, 1920, III, 271.)

For further comment, sound and shrewd, on this volume and upon the three essays here reprinted from it, see Lewis E. Gates's edition of *Selections from Arnold*, New York, 1898, pp.xxxvi–xliii. Gates points out that Arnold's doctrine of poetry as a criticism of life had been implied in his lecture on translating Homer, and made more explicit in the *Last Words* added to those lectures. This doctrine is elaborated in 'Wordsworth,' 'The Study of Poetry,' and 'Byron.' In 'The Study of Poetry' we see finally Arnold's prophetic, well-qualified statement that 'in poetry, as a criticism of life under the conditions fixed for such a criticism by the laws of poetic truth and poetic beauty, the spirit of our race will find . . . as time goes on and as other helps fail, its consolation and stay.' (*Cf.* Gates, *op.cit.*, p.xxxvi.)

CIVILIZATION IN THE UNITED STATES

In 1888 (a second edition appeared in the same year) was published in Boston a collection of Arnold's essays, in a volume entitled *Civilization in the United States: First and Last Impressions of America*. The four essays in it are 'General Grant. An Estimate' (in two parts); 'A Word about America'; 'A Word More about America'; and 'Civilization in the United States.' This last essay had appeared in the *Nineteenth Century* (for April, 1888 — Vol. XXIII, pp.481–96. The present reprint is from that source, hence the spelling 'Civilisation'); and it is no wonder that an American publisher reprinted it, for it is, according to Professor E.K.Brown, Arnold's 'most discerning analysis of the problems specific to civilization in North America, and one of his most skilful blendings of the records of his own experience with the statement of his social doctrines.' (*Representative Essays of Matthew Arnold*, ed. E.K. Brown, Toronto, 1936, p.210.)

THOMAS CARLYLE (1795–1881)

CHRONOLOGY

I. *Childhood and Academic Experience* (1795–1818)

1795 Born at Ecclefechan in Dumfrieshire, Scotland, on December 4, eldest of the nine children of James Carlyle (stone mason, and farmer) by his second wife, Janet Aitken, members of the Burghers, forerunners of the Free Kirk, and typical Scotch Calvinist peasants; reared in an atmosphere of frugality, discipline, labor, family clannishness, and strict piety; his father an upright, 'irascible, choleric man,' gifted with a 'bold, glowing style' of speech, 'full of metaphors'; his mother a woman of sweet and gentle nature.

1806–09 Attended Annan Grammar School, where he was solitary and persecuted until he fought the bully of the school; learned Latin, French, mathematics, and a little Greek; read omnivorously.

1809–14 Attended Edinburgh University, having walked the distance from Ecclefechan (100 miles), to qualify himself for the ministry in the Kirk; distinguished himself in mathematics, under Professor John Leslie, perhaps one of the models for Teufelsdröckh in *Sartor Resartus*; was disappointed at the low intellectual ebb of the University; read enormously in the University Library and in the Advocates' Library, in Locke, Reid, Smollett, Fielding, Cervantes, Paley, the *British Essayists*, etc.; became an intellectual leader among many students, partly because of his powerful and ironic talk, which earned him the title of 'the Dean' or 'Jonathan,' after Swift, whom he admired; delivered his first sermon, in Divinity Hall, on the text, 'Before I was afflicted I went astray' (*Psalms*, cxix,67) (1814), but had already begun to doubt his fitness for the ministry.

1814–16 Became mathematical tutor at Annan Academy; performed his duties carefully, though hating the career of schoolmaster; began to dream of intellectual greatness and fame; wrote his earliest letters, to friends of University days; read widely in French and English literature, and studied mathematics, sitting up until three in the morning 'invincibly tearing his way through Newton's *Principia*'; delivered his second (and last) sermon, in Divinity Hall, in Latin, on *Num detur religio naturalis*? (Is a natural religion possible?), which shows the influence of Hume's *Essays*, lent to Carlyle by his friend Robert Mitchell.

1816–18 Held a tutorship in a new school in Kirkaldy, of which the master was Edward Irving, later to become famous as a London preacher; developed a close friendship with Irving, in whose library he read Hume and Gibbon and lost his faith in the orthodox Christianity of his parents; made various excursions with Irving, who introduced him to Margaret Gordon, a poor but proud and high-bred young woman who admired Carlyle's rough genius and who became one of the originals of Blumine in *Sartor*; abandoned both his divinity studies and the career of schoolmaster (1818).

II. *Literary Apprenticeship: Edinburgh and Craigenputtock* (1818–34)

1818–22 Years of extreme unhappiness in Carlyle's life: the beginnings of dyspepsia, to last for sixty years; religious doubt; the search for a suitable life-work; the need of a settled life, in marriage; his engagement in hack-work as a means of support; his sense of frustration in his hopes and plans for literary greatness; his increasing horror at the misery of the poor.

1818–24 Began, and soon abandoned, the study of law; was praised in Leslie's *Geometry* for suggesting the solution of a problem; contributed to the *Edinburgh Philosophical Journal*, in chemistry and physics (1819–20); began the study of mineralogy and the reading of Madame de Staël's *Germany*, both of which led Carlyle to learn German (1819), which proved to be one of the turning points in his life; contributed articles to Brewster's *Edinburgh Encyclopaedia* (1820–23) (afterwards reprinted — except 'Pascal' — in *Montaigne and Other Essays*, 1897); met Jane Baillie Welsh, daughter of Dr. John Welsh, in Haddington, in May 1821, through Irving, who had been her tutor; obtained, through Irving's recommendation, a tutorship in the Buller family (1822); experienced a crisis in his religious conflict, in the summer of 1822 (his own Everlasting No, and Everlasting Yea); planned and executed many tasks: a review of *Faustus* in the *New Edinburgh Review* (April 1822), the keeping of a note-book, or

journal, a short story (*Cruthers and Johnson*), the *Life of Schiller* in the *London Magazine* (October 1823–September 1824).

1824–27 Published a translation of Goethe's *Wilhelm Meister's Apprenticeship* (Edinburgh, 1824); made his first trip to London, in company with the Bullers (1824), conscious of having a message to deliver to mankind: the ideas and ideals which he found in the writings of Goethe, Schiller, Jean Paul, Fichte, and other German thinkers who had enabled him to re-interpret his native Calvinism in more modern terms; visited Coleridge at Highgate, met most of the leading literary figures, and was shocked at the triumph of journalism over literature; decided to return to his native district, and to interpret German literature and philosophy to England; published a translation of Legendre's *Geometry*, and resigned the Buller tutorship (1824); published the *Life of Schiller* in book form (1825); married Jane Welsh on October 17, 1826, after a long and troublous courtship, and settled at Comley Bank, Edinburgh, where he began writing a series of essays for the *Edinburgh Review* and the *Foreign Review*, on German literature and thought (on Richter, Goethe's *Helena*, the *State of German Literature*, etc.).

1828–34 Carlyle's 'Craigenputtock period,' in which he and his wife settled at the Welshes' manor at Craigenputtock, a lonely farmhouse 'isolated among miles of dreary moorland,' where he wrote most of the essays now known as the *Critical and Miscellaneous Essays* (on Burns, Goethe, Voltaire, Novalis, Signs of the Times, Richter, Schiller, Boswell, Diderot, etc.); wrote *Sartor Resartus* (1830–31), which he attempted in vain to sell in London (1831); was visited by Emerson (1833); came to the full maturity of his thought, and exhausted the resources of German thought for himself; wearied of supporting himself by reviews; began to turn his interests to the study of the French Revolution; decided to settle in London, near the materials for his projected work.

III. *Literary Career: London* (1834–65)

1833–34 *Sartor Resartus* appeared in *Fraser's Magazine*.

1834–37 Prepared the *French Revolution*; was disappointed at the 'universal disapprobation' which greeted *Sartor* in *Fraser's*; lost the manuscript of the first volume of the *French Revolution* through fire, on its being lent to John Stuart Mill for examination; became acquainted with John Sterling, son of the 'Thunderer' of *The Times*; published *Mirabeau* and the *Diamond Necklace* for immediate funds; saw the first edition of *Sartor* appear in America, with great success, under Emerson's supervision (1836); published the *French Revolution* (1837), and at once established himself as an important literary figure; gave public lectures on German literature (first course).

1838–41 First London edition of *Sartor Resartus* (1838); twelve lectures on the History of Literature, or the Successive Periods of European Culture (second course); published *Chartism*, gave six lectures on Revolutions in Modern Europe (third course), and published the first edition of the *Critical and Miscellaneous Essays* (1839); Carlyle for the first time 'not at all poor'; gave six lectures on Heroes and Hero-Worship (fourth and last course) (1840); labored with others in the founding of the London Library; began to work on *Cromwell*; published *Heroes and Hero-Worship* (1841).

1843 Interrupted his work on *Cromwell*

in order to publish *Past and Present* as a comment and a call to action on the economic and social condition of England.

1845 Published *Oliver Cromwell's Letters and Speeches.*

1850 Published *Latter-Day Pamphlets*, pursuing in this third group of social pamphlets the social and economic criticism begun in *Chartism* in 1839.

1851 Published the *Life of John Sterling.*

1852–65 Wrote and published *Frederick the Great*; visited Germany (1852, 1858); made the first collection of his *Works* (1857); published *Ilias (Americana) in nuce* in *Macmillan's Magazine* (1863).

1843–60 Carlyle at the zenith of his influence, especially on the younger generation; universally admired, widely followed for his moral, religious, and philosophical guidance; surrounded by many friends among the great — Tennyson, Browning, Ruskin, Kingsley, Froude, Mazzini, Thirlwall, Spedding, Forster, Henry Taylor, Lord and Lady Ashburton; neglectful of his faithful and helpful, but sharp-tongued wife, whose health, never very robust, became critical during 'the nightmare of Frederick.'

IV. *Last Years* (1865–81)

1865 Elected Lord Rector of Edinburgh University.

1866 Delivered the Inaugural Address at Edinburgh (printed as *On the Choice of Books*), which spread his fame still more widely; suffered the loss of his wife (April 21) while still in Edinburgh; overpowered by his loss, became henceforth more secluded, wrote the paper entitled 'Jane Welsh Carlyle' in the *Reminiscences*; began the paper on Irving; served on the Eyre Defence Committee; went to Mentone to finish the *Reminiscences.*

1867 Published *Shooting Niagara, and After?* (on the dangers of extending the franchise, as provided in the second Reform Bill).

1869 Edited his wife's letters as a kind of penance for his shortcomings in relation to her.

1870 Published a letter to *The Times* on the Franco German war, defending the cause of Germany.

1874 Received the Prussian Order of Merit; declined a pension and the Grand Cross of the Bath, offered by Disraeli; lost the use of his right hand.

1875 Published *Early Kings of Norway* and *Portraits of John Knox.*

1881 Died on February 5; buried in Ecclefechan churchyard.

COMMENTARY

'If we were asked what [Carlyle's] genius did for English thought and literature, we should say that it did chiefly the work of a sort of spiritual volcano, — showed us the perennial fire subversive of worn-out creeds which lies concealed in vast stores beneath the surface of society, and the thinness of the crust which alone separates us from that pit of Tophet, as he would himself have called it. And yet, in spite of himself, he always strove to sympathise with positive work. His teaching was incessant that the reconstruction of society was a far greater work than the destruction of the worn-out shell which usually preceded it, — only, unfortunately, in his own time, there was hardly any species of reconstructive effort which could gain his acquiescence, much less his approval. He despised all the more positive political and philanthropic tendencies of his time; felt little interest in its scientific discoveries; concerned himself not at all about its art; scorned its economical teaching; and rejected the modern religious instructors with even more emphatic contumely than the "dreary professors of a dismal science." To Carlyle, the world was out of joint, and his only receipt for setting it right, — the restoration of "the beneficent whip" for its idlers, rogues, and vagabonds, — was

never seriously listened to by thinking men. Consequently, all that he achieved was achieved in the world of thought and imagination. He did succeed in making men realise, as they never realised before, into what a fermenting chaos of passion human society is constantly in danger of dissolving, when either injustice or insincerity, — what Mr. Carlyle called a "*sham*," — is in the ascendant, and rules by virtue of mere convention or habit. He did succeed in making men realise the wonderful paradox of all social order and discipline, in depicting to us the weakness and the hysterical character of much that is called patriotic and humane impulse, in making us see that justice and strength and a certain heroism of courage are all necessary for the original organisation of a stable society; and that much sensibility in the body corporate, so far from making this organisation easier, is apt to make it both more difficult and more unstable. Carlyle's greatest power was the wonderful imaginative genius which enabled him to lift the veil from the strange mixture of convention, passion, need, want, capacity, and incompetence called human society, and make us understand by what a thread order often hangs, and how rare is the sort of genius to restore it when once it goes to pieces. No one ever performed this great service for the world as Carlyle has performed it in almost all his works, — notably in *The French Revolution* and *Sartor Resartus*, and this alone is enough to entitle him to a very high place among the Immortals of literature.

'And he had all the gifts for this great task, — especially that marvellous insight into the social power of symbols which made him always maintain that fantasy was the organ of divinity. He has often been called a prophet, and though I have too little sympathy with his personal conception of good and evil so to class him, — though religious seer as he was, he was in no sense Christ-like, — he certainly had to the full the prophet's insight into the power of parable and type, and the prophet's eye for the forces which move society, and inspire multitudes with contagious enthusiasm, whether for good or ill. He fell short of a prophet in this, that his main interest, after all, was rather in the graphic and picturesque interpretation of social phenomena, than in any overwhelming desire to change them for the better, warmly as that desire was often expressed, and sincerely, no doubt, as it was entertained. Still, Carlyle's main literary motive-power was not a moral passion, but a humorous wonder. He was always taking to pieces, in his own mind's eye, the marvellous structure of human society, and bewildering himself with the problem of how it could be put together again. Even in studying personal character, what he cared for principally was this. For men who could not sway the great spiritual tides of human loyalty and trust, he had — with the curious exception of Goethe — no very real reverence. His true heroes were all men who could make multitudes follow them as the moon makes the sea follow her, — either by spiritual magnetism, or by trust, or by genuine practical capacity. To him, imagination was the true organ of divinity, because, as he saw at a glance, it was by the imagination that men are most easily both governed and beguiled. His story of the French Revolution is a series of studies in the way men are beguiled and governed by their imagination, and no more wonderful book of its kind has ever been written in this world, though one would be sorry to have to estimate accurately how much of his picture is true vision, and how much the misleading guesswork of a highly-imaginative dreamer.

'It is in some respects curious that Carlyle has connected his name so effectually as he has done with the denunciation of Shams. For the passionate love of truth in its simplicity was not at all his chief characteristic. In the first place, his style is too self-conscious for that of sheer, self-forgetting love of truth. No man of first-rate

simplicity — and first-rate simplicity is, I imagine, one of the conditions of a first-rate love of truth, — would express common-place ideas in so roundabout a fashion as he; would say, for instance, in recommending Emerson to the reading public, "The words of such a man, — what words he thinks fit to speak, — are worth attending to"; or would describe a kind and gracious woman as "a gentle, excellent, female soul," as he does in his *Life of Sterling*. There is a straining for effect in the details of Carlyle's style which is not the characteristic of an overpowering and perfectly simple love of truth. Nor was that the ruling intellectual principle of Carlyle's mind. What he meant by hatred of shams, exposure of unveracities, defiance to the "Everlasting No," affirmation of the "Everlasting Yea," and the like, was not so much the love of truth, as the love of divine force, — the love of that which had genuine strength and effective character in it, the denunciation of imbecilities, the scorn for the dwindled life of mere conventionality or precedent, the contempt for extinct figments, not so much because they were figments, as because they were extinct and would no longer bear the strain put upon them by human passion. You can see this in the scorn which Carlyle pours upon "thin" men, — his meagre reverence for "thin-lipped, constitutional Hampden," for instance, and his contempt for such men as the Edgeworth described in John Sterling's life, whom he more than despises, not for the least grain of insincerity, but for deficiency in *quantity* of nature, and especially such nature as moves society. Greatly as Carlyle despised "cant," he seems to have meant by cant not so much principles which a man does not personally accept, but repeats by rote on the authority of others, as principles which have ceased, in his estimation, to exert a living influence on society, whether heartily accepted by the individual or not. Thus, in his life of Sterling, he indulges in long pages of vituperation against Sterling for taking to the Church, — not that he believed Sterling to be insincere in doing so, but because what Carlyle called the "Hebrew old clothes" were to his mind worn out, and he would not admit that any one of lucid mind could honestly fail to see that so it was.

Carlyle, in short, has been the interpreter to his country, not so much of the "veracities" or "verities" of life, as of the moral and social spells and symbols which, for evil or for good, have exercised a great imaginative influence over the social organism of large bodies of men, and either awed them into sober and earnest work, or stimulated them into delirious and anarchic excitement. He has been the greatest painter who ever lived, of the interior life of man, especially of such life as spreads to the multitude, not perhaps exactly as it really is, but rather as it represented itself to one who looked upon it as the symbol of some infinite mind, of which it embodied a temporary phase. I doubt if Carlyle ever really interpreted any human being's career, — Cromwell's, or Frederick's, or Coleridge's, — as justly and fully as many men of less genius might have interpreted it. For this was not, after all, his chief interest. His interest seems to me always to have been in figuring the human mind as representing some flying colour or type of an Infinite Mind at work behind the Universe, and so presenting this idea as to make it palpable to his fellow-men. He told Sterling he did not mind whether he talked "pantheism or pottheism," — a mild joke which he so frequently repeated as to indicate that he rather overrated its excellence, — so long as it was true; and he meant, I think, by being true, not so much corresponding to fact, as expressing adequately the constant effort of his own great imagination to see the finite in some graphic relation to the infinite. Perhaps the central thought of his life was in this passage from *Sartor Resartus*, — "What is man himself, but a symbol of God? Is not all that he does symbolical, — a revelation

to sense of the mystic God-given power that is in him, a gospel of freedom, which he, the 'Messias of Nature,' preaches, as he can, by act and word? Not a hut he builds but is the visible embodiment of a thought, but leaves visible record of invisible things, but is, in the transcendental sense, symbolical as well as real." Carlyle was far the greatest interpreter our literature has ever had of the infinite forces working through society, of that vast, dim back-ground of social beliefs, unbeliefs, enthusiasms, sentimentalities, superstitions, hopes, fears, and trusts, which go to make up either the strong cement, or the destructive lava-stream, of national life, and to image forth some of the genuine features of the retributive providence of history.'

— Richard Holt Hutton, 'Thomas Carlyle,' *Criticisms on Contemporary Thought and Thinkers*, I, London, 1908, pp.8–14.

'The first name affixed to Carlyle to signify a perception of the difference of his ways of thinking from those of other people was *Mystic*. . . . It was the novelty of Carlyle's principles to those among whom they were first propounded, the strangeness of the objects he tried to bring within their ken, that occasioned the resort to such a misfitting epithet. A far fitter designation would have been *Transcendentalist*. . . . It is easy enough to understand, and we have really no other name so suitable for the thing.

'A *Transcendentalist* in philosophy is the very opposite of what we call a *Secularist*. He is the opponent of that system of philosophy which "apprehends no farther than this world and squares one's life according," that system of philosophy which regards the visible universe of time, space, and human experience as the sum-total of all reality, and existing humanity in the midst of this universe as the topmost thing now in being. Beyond, and around, and even *in* this visible universe, the Transcendentalist holds, — this world of sun, moon, and stars, and of the earth and human history in the midst, — there is a supernatural world, a world of eternal and infinite mystery, invisible and inconceivable, yet most real, and so interconnected with the ongoings of the visible universe that constant reference to it is the supreme necessity of the human spirit, the highest duty of man, and the indispensable condition of all that is best in the human genius. In this sense Carlyle was a transcendentalist from the very first. He believed in a world of eternal and infinite realities *transcending* our finite world of time, space, sense, experience, and conceivability. . . .

'He remained to the end what may be called a *Realistic Transcendentalist* or *Transcendental Realist*. By this is meant that he was satisfied to think of the world of space and time, and of all physical and historical realities, as having substantially existed, in its essential fabric at least, very much as we imagine it, by an independent tenure from the Infinite, distinct from that of all past or present conceiving minds inserted into it and in traffic with it.

'Here, however, we may note an interesting peculiarity of his special form of Realistic Transcendentalism, which latterly gave him some trouble. Though he talks of "rude nations," "rude times," etc., and recognised perhaps a certain progress in human conditions and even in the human organism, he seems essentially to have always thought of humanity as a self-contained entity, fully fashioned within itself from the first, and cut off from all its material surroundings and from any priority of material beginnings. Hence his oppugnancy in his latter days to the modern scientific doctrine of evolution as brought into vogue more especially by the reasonings of Darwin. . . .

'. . . On the whole, one may say that he lived too late to be able to accept the modern scientific doctrine of evolution and work it into his philosophy, and remained therefore at the last a transcendental realist of the old school. Or perhaps, with the

foregoing passage to enlighten us, it might be fairer to say that, whatever conceptions of a cosmic evolution science might bring in, he found them irrelevant to the main matter, and did not care a rush about them in comparison with the main matter, — which was that men should continue to believe that all things had originated in a supreme and infinite eternal, the reality of all realities, and should walk in that belief as their religion. . . .

'Dropping now all terms of scholastic nomenclature, we may say, more simply, that Carlyle went through the world as a fervid Theist. . . . When he avoided the simple name "God" or "the Almighty," and had recourse to those phrases, — "the Immensities," "the Eternities," "the Silences," "the Infinite Unnameable," — which we now think of, perhaps smilingly, as peculiar forms of the Carlylian rhetoric, it was, as he himself tells us, because "the old Numen" had become as if obsolete to "the huge idly impious million of writing, preaching, and talking people," and he would employ any synonyms or verbal shifts by which he could hope to bring back the essential notion. In his latter days, and always in his own pious self-communings, he seems to have preferred the simple old name he had learnt from his father and mother, with its heart-thrilling and heart-softening associations. . . .

'Now, as Carlyle had wholly given up the metaphysic of Christianity, he cannot be classed among the Christians, and thought it honest to avow that he could not be so classed. Indeed, more and more, his attitude towards Christian theology in any of its known and orthodox forms settled into positive antipathy, till at last he declared it to be inconceivable to him that any man of real intellect could be found in that camp without something of conscious insincerity, and looked askance therefore on even such ecclesiastical friends of his own as Bishop Thirlwall and Bishop Wilberforce. This feeling found vent in such violent phrases as *shovel-hattedness, the Jew-God*, etc.; and he had even been so daring as to project a book or pamphlet to be called *Exodus from Houndsditch*, the purport of which was to be that people ought universally, as fast as they could, to come out of the land and atmosphere of all Jewish forms and traditions, older or later, only taking care to pack up what was really their own and bring *that* along with them. Strange to observe all the while his passionate sympathy with the old Hebraic spirit as manifested in the Hebrew Prophets, the intensity of his fascination for the life and character of Christ as it is represented in the Gospels, and the depth of his recognition of the originality and beauty of the Religion of Sorrow and the power of the symbol of the Cross among the nations hitherto. He seemed, however, to think that this power had pretty nearly stopped, for the highest and most cultivated intellects, somewhere in the seventeenth century, about the time of the English Puritans and of Oliver Cromwell. So far as it had survived that time, it was, he seemed to think, in individual spirits here and there of the humbler and less instructed order, such as those Scottish ministers of the best type he had known in his childhood and his own pious father and mother. In all this, surely, Carlyle was in serious error. Had he not been too hasty in judging what might honestly coexist with what else in a strong human mind of his own generation? Had he not underestimated the durability of the Christian metaphysic in the world, whether in its Puritan form or in another, the power of that metaphysic even yet to find noble souls susceptible of it, to pierce these souls and lodge itself in them even to the dividing asunder of the joints and marrow, and so to zigzag in unexpected fire over the earth and disseminate itself in great new expanses?

'Can we be more precise as to Carlyle's own religion than by merely describing it as a fervid Natural Theism? I believe that we can. His religion, it appears to me, was

a compound of two elements, one furnished from within, the other found without. In the first place, he held, there was the divine within man himself, that extract or inspiration of Deity which is incorporate with the very structure of the human soul, and always throbs there in the form of conscience, upward tendency, the sense of right and wrong, of the noble and the ignoble. No human soul, even the meanest, but had this structural equipment, and knew, by the very fabric of its constitution, what was right or wrong, good or bad, at any particular moment. The structural faiths of the soul of man, therefore, the constitutional postulations of the human spirit, made towards a religion, and did not leave man in a state of agnosticism. We walk by *faith*, — *i.e.* by necessary constitutional postulation and imagination accordingly. But, further, in the actual world out of ourselves through which we walk, in our experience of that world at present and in the history of that world as it comes to us by record, we meet that which rushes into union with this faith within. The world without, as well as the spirit within, was made by God, and is governed by God; what we see there, all that we see, is God working. "What are all our histories and traditions of actions in former times," asked Cromwell in one of his speeches, "but God manifesting Himself, that He hath shaken, and tumbled down, and trampled upon, everything that He hath not planted?" This expresses exactly one part of Carlyle's religion. The superiority of the right and noble over the wrong and ignoble, the conquering power of the right and noble in the long run, and the futility or nothingness of evil, were evident in the actual rule and history of the world, preached in disaster, ruin, retribution. Divine justice stared upon you out of the very fact of things. Hence Carlyle's fondness for the phrase "the fact of things," his hammering repetitions of the word "fact," "fact"; hence his continual assertions that more of genuine instruction and spiritual nutriment is to be found in the observation and study of realities than in all fiction of so-called ideals; hence his preference of History over all other forms of Literature, or indeed contention that History includes them all, even Poetry itself. All real wisdom, all sound morality, all that is good in private thought and conduct, or in public action and statesmanship, consists, he maintained, in accurate perception of God's will as revealed in the fact of things, and in zealous co-operation therewith and with nothing else. The impassioned going out of the divine within man to grasp and clasp the divine in the world of phenomena around him, the impassioned consent of the human spirit to subserve the ascertained workings of God, — that, according to Carlyle, was true religion, a sufficient religion, and the only religion a man could have. Here was certain knowledge, and to this extent there was a remove for us out of any torpid inane of so-called Agnosticism.

'In secondary points, however, Carlyle did not refuse the name of an agnostic, but maintained that, by necessity, all men are and must ever remain agnostics. . . .

'All in all, when one examines Carlyle's religion, one does not find that it differs very much from that Hebraic or Semitic Theism on which he commented sometimes so contemptuously, and to which he thought he had bidden farewell. *Minus* the ceremonialism and the miraculous particulars, it is the religion of the Old Testament, the religion of Job, Isaiah, and Ezekiel. If Carlyle individually had made the exodus he wanted to see general, what he had packed up and brought with him as his own out of the deserted land and its detested comradeship had a very considerable resemblance to the peculiar growths generally supposed to be there native. Herein he was not so very different from many of his fellow-countrymen who are credited with having made the same exodus, though in a different and more orthodox direction, — to wit from Judaism

to Christianity. In English and Scottish Puritanism to this day the influence from the Old Testament prevails visibly, almost overwhelmingly, over the ingredient from the New. True, Carlyle's curious antipathy to the Jewish race led him to an avowed preference for the old Teutonic or Norse mythology over the Hebrew religion, and even to the wildly exaggerated assertion that everything best and highest in the modern world is of Teutonic or Norse origin; but his own soul was more Hebraic essentially than it was Norse. The intensity of his theism was Hebraic; and one is not sure of anything more specially Norse in him than the broad general strength of manhood which he united with his earnestness, and the riotous humour which flooded that strength and mitigated its fierceness.

'It would not be difficult to show that Carlyle's main doctrines in social and political matters, his well-known moral and historical Carlylisms, were all deductions, in one way or another, from his theory of religion.

'Then what of the famous Carlyle doctrine of "Hero-worship," — a word, by the bye, which was not of Carlyle's own invention, but which he found in David Hume's Essays, and probably borrowed thence? . . . In the Carlyle hero-worship, so far as you may care to adopt it, your reverence for those of your fellow-creatures that seem worthiest of reverence is invoked expressly on the principle that they were servants of God and may be regarded as manifestations of God. The real God who made them, and who made you, still fills the universe; and it is He that is walking on the wings of the wind. Though, if you adopt the Carlyle hero-worship on these terms, you may save your theism, there is the further difficulty, however, of his own particular choice of heroes for you. His supreme heroes in the world's history, those for whom his own admiration, so far as I could ever make out from his private talk, approached the boundless, and would admit of no carping or fault finding even from himself, were Dante, Luther, John Knox, Shakespeare, Cromwell, and Goethe; and, as respects these six, or several of them, the objection to go along with him need not, in our quarter of the world at least, be very general. But among his minor heroes some have been voted more questionable, especially those in whom, despite his recommendations of them, the ordinary mind could see nothing but a representation of energy, and even of brutal energy. One of the complaints against him, as you all know, has been on the ground of the frequency in his books of this deification of mere force, and the incessant propagation there of the paradox that might is right. He took the trouble at last to explain that he had been misunderstood in this matter, and that, if his teachings on the subject were properly investigated, it would be found perhaps that the maxim as it lay in his own heart was the reverse, — to wit that right in the long run is always might. . . .

'One might pursue further the ramifications of Carlyle's root-theory into its particular social applications. Enough just to note his vehement oppugnance throughout his whole life, and especially in his later life, to the modern faith in Democracy, the equality of all men in respect of natural and political rights, and government by suffrage and the representation of majorities. In this also we see his fidelity to his root-theory. There always had been, and always would be, he thought, a radical inequality, amounting even to incommensurability, among human beings in respect of the amount of wisdom and goodness possessed by them individually, — *i.e.* in respect of that amount of the divine in themselves by which they are fitted to apprehend the external fact of things and promote God's purposes therein. Hence it had been eternally pre-appointed that the wiser everywhere should rule over the less wise, by guidance when possible, by compulsion when necessary; and that system

of social conditions and arrangements was the best everywhere for any community which gave the greatest chance that the ablest and wisest persons in that community should be found in the governing places.

'In any criticism of Carlyle in his character of a *moral force* working in and through literature, the most obvious consideration is that he had constituted himself from the first, and remained to the last, a preacher of just such structural faiths of the human spirit, as he conceived them to be, and just such immediate derivatives from these, as we have been describing. In other words, he kept chiefly in his teachings to what he himself called the *dynamics* of human nature, — "the primary, unmodified forces and energies of man, the mysterious springs of love and fear and wonder, of enthusiasm, poetry, religion, all which have a truly vital and infinite character," — and did not concern himself so much with the *mechanics* of human nature, or that complexity of practical details and processes which one meets with in daily life and in the actual society of every body-politic. In still other words, perhaps more acceptable to some, it may be said that he drove through the world on the wheels of certain cardinal asseverations of his own constitution, which he took to be cardinal asseverations also of the human constitution in general, and therefore to be of universal, eternal, and *a priori* validity. No reason on that account to challenge his title to the distinction of even extraordinary greatness among his contemporaries. More than is imagined, the world *is* governed and always *has been* governed by asseverations; and by what asseverations can it be better governed than by those put forth by its most gifted and noblest minds as expressing their own constitutional beliefs, their own deepest and most structural forms of faith? . . .'

— David Masson, *Carlyle: Personally and in his Writings; Two Edinburgh Lectures*. London, 1885, pp. 70,71–72,73–74,78,80–82,86–91,93–95,96–98,100–03.

Works

a. COMPLETE WORKS (PRINCIPAL EDITIONS)

Collected Works. 16 vols. London,1857–58. (First collected edition.)

Library Edition. 34 vols. London,1869–71.

People's Edition. 37 vols. London,1871–74.

Ashburton Edition. 17 vols. (With 3 supplementary vols.) London,1885–88.

Centenary Edition. Ed. by H.D.Traill. 30 vols. London,1896–99. New York,1896–1901.

b. SEPARATE WORKS

Wilhelm Meister's Apprenticeship: a Novel from the German of Goethe. 3 vols. Edinburgh,1824.

The Life of Schiller, Comprehending an Examination of his Works. 1825. (First published as *Schiller's Life and Writings*, in the *London Magazine*, VIII [1823],381–400; IX [1824],37–59; X [1824],16–25,149–63,259–69.)

German Romance. Specimens of its chief authors; with biographical and critical notices. By the translator of *Wilhelm Meister*, and the author of the *Life of Schiller*. 4 vols. Edinburgh,1827. (Vol. I, Musaeus and Fouqué. Vol.II, Tieck

and Hoffmann. Vol.III, Richter. Vol. IV, Goethe.)

Sartor Resartus: the Life and Opinions of Herr Teufelsdröckh. In three books. With preface by R.W.Emerson. Boston, 1836; London,1838. (First published in *Fraser's Magazine*, VIII [1833],581–92,669–84; IX [1834],177–95,303–13, 443–55,664–74; X [1834],77–87,182–93.)

The French Revolution: a History. 3 vols. 1837; 3 vols. Boston,1838.

Lectures on German Literature. (Delivered 1837; not published; see *Spectator*, May 6, 1837, for condensed report.)

Lectures on the History of Literature. 1838; ed. J.R.Greene, London,1892; ed. R.P.Karkaria, Bombay,1892.

Critical and Miscellaneous Essays. 4 vols. Boston,1838; 4 vols. London,1839.

Six Lectures on Revolutions in Modern Europe. (Delivered 1839, not published. See R.H.Shepherd, *Memoirs of the Life and Writings of Thomas Carlyle*, Vol. I, London,1881,pp.197–214, for a report of the lectures.)

*Chartism.*1840.

On Heroes, Hero-Worship, and the Heroic in History. Six lectures. Reported with emendations and additions. 1841.

Past and Present. 1843.

Oliver Cromwell's Letters and Speeches: with Elucidations. 2 vols. 1845.

Latter-Day Pamphlets, 1850. (Eight pamphlets as follows: I [February], The Present Time; II [March], Model Prisons; III [April], Downing Street; IV [April], The New Downing Street; V [May], Stump-Orator; VI [June], Parliaments; VII [July], Hudson's Statue; VIII [August], Jesuitism.)

Life of John Sterling. 1851.

The History of Friedrich II of Prussia, called Frederick the Great. 6 vols. 1858–65.

Inaugural Address at Edinburgh, April 2nd, 1866. Edinburgh and London, 1866. (Rptd. as *On the Choice of Books*, ed. J.C.Hotten. London,1866, 1869; also, under same title, by Samuel Mullen, London,1866.)

The Early Kings of Norway; also an Essay on the Portraits of John Knox. 1875. (Rptd. from *Fraser's Magazine*, N.S. XI [1875],1–26,135–55,273–88.)

NOTES

CHARACTERISTICS

One of the most stimulating and significant of Carlyle's essays, 'Characteristics' appeared in the *Edinburgh Review* in December 1831, ostensibly as a review of Thomas Hope's *Essay on the Origin and Prospects of Man* (London, 1831), and Friedrich von Schlegel's *Philosophische Vorlesungen, insbesondere über Philosophie der Sprache und des Wortes* [Philosophical Lectures, especially on the Philosophy of Language and the Gift of Speech] (Vienna, 1830). The title of Carlyle's essay was probably suggested by the use of the word by such of his favorite German writers as Schlegel himself and the philosopher Johann Gottlieb Fichte. The latter was the author of a trenchant criticism of the eighteenth and the early nineteenth centuries, *Characteristics of the Present Age* (Die Grundzüge des Gegenwärtigen Zeitalters) (1806); Schlegel had used the word, more or less in Carlyle's sense, in his critical writings. 'Characteristics,' a survey of the dominant features in the intellectual climate of Carlyle's early years, was written in the autumn of 1831, when Carlyle was in London seeking a publisher for *Sartor Resartus*. In some respects it is a continuation of, and an addition to, the ideas which he had set down in the manuscript of *Sartor*; in other respects it is a continuation of his essay 'Signs of the Times,' which had appeared in the *Edinburgh Review* in June 1829. Froude exaggeratively maintained it to be 'more profound and far-reaching even than "Sartor."' Certainly no study of Carlyle is complete without careful consideration of this essay, with its attack on the self-consciousness of modern life, our passion for analysis, organization, utility, political panaceas, and physical and social mechanisms. The Whig contributors to the *Review* were offended at the editor for accepting an article so at variance with the watchwords and ideals of the new middle-class liberalism, and after the appearance of an article on Corn Law Rhymes, already arranged for, no more essays by Carlyle appeared in its pages.

BIOGRAPHY

This essay was originally intended to be the earlier part of Carlyle's essay on Croker's edition of *Boswell's Life of Johnson* (1831) (see below). It was prepared in London during the proof-reading of 'Characteristics' in the winter of 1831–32, and was published in *Fraser's Magazine* in April 1832. Its importance lies in its statement of Carlyle's glorification of *fact*, in his original approach to history through biography, and in his exaltation of sympathetic insight ('an open loving heart') in the ideal biographer. It therefore aids not only in an understanding of the essay on Boswell but also of Carlyle's technique in dealing with the French Revolution, Cromwell, and Frederick the Great; and it foreshadows, in some respects, the doctrines set forth in *Heroes and Hero-Worship*.

BOSWELL'S LIFE OF JOHNSON

The essay on Johnson and the earlier essay entitled 'Characteristics' won for Carlyle the wonder and applause of the London reading world, and increased the circle of young men who were beginning to look upon him as their teacher. Though he had failed to find a publisher for *Sartor*, he had made many new and influential friends, and had been quickened to new literary effort by their encouragement. John Stuart Mill declared 'the paper on Biography and on Johnson' better than anything else that he had read for years past, and so vivid was it in his memory that he could almost repeat it by heart. It was these early essays also which brought Emerson to Craigenputtock, to view the young prophet of a new and stimulating religious philosophy in an age rapidly becoming harshly secular. Readers everywhere were soon to compare Carlyle with Macaulay on their interpretations of Johnson and Boswell. Carlyle's essay followed Macaulay's by eight months, appearing in *Fraser's Magazine* in May 1832. In Carlyle's discussion of Johnson there is considerable emphasis on Hero-worship as a means to reform, not the external reform of the innovating liberals, but the kindling of the soul by contact with another and greater individual. In regarding Johnson as a 'hero,' Carlyle was following a general tradition, but his treatment of Boswell was a most audacious revolt against that other tradition, immortalized by Macaulay's paradoxes, that Boswell was a consummate fool. A comparison of the two essays is highly illuminating.

SARTOR RESARTUS

Sartor Resartus was composed at Craigenputtock in 1830–31, originally in the form of a magazine article, and was later expanded into two essays which were rejected by *Fraser's Magazine*. In its final form it contained the material in the two essays ('Thoughts on Clothes'), portions of an unfinished novel, *Wotton Reinfred*, written in Edinburgh in 1827, and additional material developed between the date of *Fraser's* rejection and July 1831. Some of the raw material of *Sartor* may be found in Carlyle's *Notebooks*; and the germs of many of its themes were suggested by Pascal, *Reinecke Fuchs*, the Bible, and Swift (*Tale of a Tub*, Sect.II). It was the culmination of Carlyle's thought and conviction during his years of apprenticeship at Craigenputtock, where he had written review articles and thought his way to his own philosophy. In it are to be found, expressed or implied, all the teachings which were to make him a powerful Victorian leader. In it Carlyle's style reached its maturity, and developed that picturesque, half-humorous, half-tragic, gnarled and 'German' quality which drew both amazed admiration and angry censure from his readers.

The general theme of *Sartor* is expressed in its Latin title, 'The Tailor Re-tailored': man, the maker of symbols and tools to express his soul, in language, institutions, laws, finds himself in these modern times nearly stripped of his garments. His beliefs, creeds, dogmas, conceptions of him-

self and the world, have all gone to tatters, owing largely to the tremendous advance of thought and science in the seventeenth and eighteenth centuries. In 1830, Carlyle believed that the impressive achievements of man's understanding threatened to overwhelm him with materialistic, utilitarian, and atheistic conclusions. Already the Romantic movement, especially as represented by Byron, was in revolt against many of the fundamental tenets of religion. And Carlyle, aware that modern man could no longer think in terms of the old dogmas, sought to reaffirm the spiritual nature of the world and man, by showing that all that is called physical, mechanical, and utilitarian is but the imperfect expression, symbol, or garment of the inner reality, spirit. The universe is the 'Garment of God,' man's body the garment of his soul, man's institutions, traditions, languages, and arts but the manifestation of his spirit. This is the simple theme that underlies all the riotous humor, pathos, and eloquence of the book.

Sartor Resartus is divided into three Books; the first and third are discursive, the second 'biographical.' Carlyle pretends to be the editor of the papers of an eccentric German professor in Weissnichtwo (*Know-not-where*), and from the papers he draws both a biography of Professor Teufelsdröckh and a series of passages on the history of clothes, the spiritual nature of the world, the symbolical nature of all matter, the superiority of Reason (spiritual insight) over Understanding (the mind working logically), and the social significance and application of these doctrines. The device of 'editing' an imaginary person's papers permitted Carlyle to revel in extravagant humor, recondite allusion, and frequent digression. Thus the fundamental orderliness may at first be invisible, especially in the early and more exuberant chapters. But once we are familiar with Carlyle's language and tone, his ideas become increasingly clear. The titles of the chapters in Books I and III are significant. 'The World in Clothes' is merely the material world, which expresses the Spirit within it, and man as a creature of that world is a tool-using animal, expressing himself through his implements. For Carlyle this is an astonishing mystery. 'The World out of Clothes' is of course the spiritual world, the mysterious, invisible, indefinable Force within the physical universe and within man, which creates, and moves, and transcends space and time. 'Pure Reason' is for Carlyle that direct insight into the truth of things, which sees that 'the beginning of all Wisdom is to look fixedly on Clothes' (*i.e.* on matter as merely the revelation of inner and spiritual reality). 'Prospective,' as a title, suggests the later application of these ideas to 'all visible things,' to nature, man, society. In Book III, this application is made, and Carlyle discusses government, religion, social reconstruction, education, and politics from the standpoint of his doctrine that modern man must weave new garments for his convictions, construct new institutions, laws, traditions, and philosophical and religious concepts which will both conserve the spiritual wisdom of the past and free men's minds from bondage. Out of the wreckage of the modern world the forces of union ('organic filaments') will knit a new fabric of life, religion, society; and a new world will rise, phoenix-like, from the ashes of the old. Men will then see that what is natural is essentially mysterious, and, having abandoned the old ecclesiastical miracles, will recognize a new, a '*natural* supernaturalism.'

Into Book II Carlyle put a great deal of his own intense experience. The most famous chapters are those recording Teufelsdröckh's conversion, which, to some extent, is a picture of what happened to Carlyle in Leith Walk, Edinburgh, in the summer of 1822. 'The Everlasting No' is Carlyle's rhetorical name for the act or state of spiritual negation into which the young Teufelsdröckh fell when he lost his sweetheart, Blumine, to his friend Herr

Towgood, and when, in his suffering, he discovered that he had no faith either in his own moral freedom or in the purposefulness of the world. To him the universe was but a machine, and men merely the helpless victims of unalterable law. In the depths of his despair, he notes that he can at least hate this apparent fact, and defy it; and his act at once gives him a sense of freedom, of individuality, and of moral personality. In 'The Centre of Indifference,' Teufelsdröckh wanders over the world, in resigned sadness, not yet able to grasp upon the materials about him for the construction of a new life and faith. He speculates on human institutions, traditions, arts, and experiences. 'The Everlasting Yea' occurs as soon as he discovers the importance of renunciation, of ceasing to grasp selfishly after happiness and knowledge. This act is followed by his discovery that suffering and duty have a higher reality than pleasure. The world becomes less hostile to him, and men appear again as his brethren; reverence and pity replace rebellion and disgust. And Teufelsdröckh announces his own theory of the origin of evil, namely, the Infinite in man, which seeks in vain a complete expression, and if directed toward selfish ends becomes destructive. The final step in the 'Everlasting Yea' is the will to act, to produce, beginning perhaps on humble tasks, and using the actual (the physical world) as the material for the realization of the ideal (the spiritual). Teufelsdröckh has thus re-tailored his religious convictions, given them new and undogmatic garments.

Sartor Resartus is the most intensely concentrated of all of Carlyle's works, and the elucidations just presented merely suggest the range and variety, the subtlety and far-reaching implications, of the book as a whole. Its first publication, serially, in *Fraser's Magazine* from November 1833 to August 1834, was greeted by 'unqualified disapprobation,' many readers believing literally in the existence of Teufelsdröckh, and many others recoiling from the perverse obscurity of the book. It did not acquire book form in England (1838) until after Emerson had introduced it into America, and after Carlyle had won fame securely by his *French Revolution*. It was eventually to become Carlyle's 'best seller,' and is today perhaps the work which most completely reveals his mind and thought.

THE FRENCH REVOLUTION

This work is Carlyle's chief claim to the title of artist. In it he takes the raw material of history, interprets it according to his philosophical outlook, and presents it in flaming colors and exciting drama. It was the work by which Carlyle first securely established himself as a 'star of the first magnitude in English literature' in his time. His method differed radically from the methods of Robertson, Hume, Hallam, and Brougham, in that it laid stress not so much on the merely political, military, and institutional aspects of the revolution, as on the growth of mass opinion and conviction, on panoramic views of historical happenings, on the psychological and moral springs of action in both the general population and its leaders, and on the great issues of moral and political justice working themselves out in the travail of the French nation. Above all, Carlyle sought to make the reader *see*; the chapters in the present collection are excellent examples of that attempt. The role of the obscure but momentarily important individual, the apparent chaos of activity, the connection between seemingly distant or irrelevant happenings, the mounting tempo of the historical incident, the many ironies, great and small, the intensely human quality of the entire scene, Carlyle's eloquent sympathetic understanding of multitudes of diverse characters, and his ever-present *audible* manner of narrating, expostulating, lamenting, commenting, and summarizing — all these make his history unique in pictorial power and moral intensity.

The history was read with great enthusiasm by Southey, John Stuart Mill (who gave it a handsome review, partly because his maid had accidentally burned the first volume of the manuscript), by Sir William Hamilton, Dickens, Lord Jeffrey, and Thackeray (who reviewed it in *The Times*). Together with Carlyle's essays 'On History' and 'On History Again' (in *Fraser's*, 1830 and 1833, respectively), *The French Revolution* provided one great impetus to the study and writing of history, for which the nineteenth century became more notable than any previous era.

ON HEROES AND HERO-WORSHIP

Owing to the oral nature of the original form, this work is one of the most readable, and therefore one of the most popular, of Carlyle's works. For the same reason there is perhaps more than usual repetition of ideas, treatments, and paraphrases; in the present collection, therefore, certain deletions have been made wherever they would not damage the completeness or continuity of the thought.

'The Hero as King' is seldom reprinted except in a reprint of the entire work, and its importance is seldom recognized. It is noteworthy for two reasons: (1) Carlyle expressly states that the hero as king is 'the most important of Great Men,' and (2) in dealing with him Carlyle makes a more careful summary of the qualities of the true hero than he provides elsewhere. This lecture foreshadows much in Carlyle's later social writings, such as *Past and Present* and *Latter-Day Pamphlets*, and expresses many of the conceptions and convictions which are applied specifically in *Cromwell* and *Frederick the Great*.

It is noteworthy that Carlyle presented no lecture on the hero as philosopher, the hero as man of science, or the hero as painter, musician, or sculptor. A comparison between Carlyle's work and Emerson's *Representative Men* is often made, with fresh insight into the aims of both writers.

PAST AND PRESENT

This is Carlyle's first, and no doubt his greatest, social criticism of any considerable length. In the midst of his labors on *Cromwell*, he wrote, 'My heart is sick to look at the things now going on in this England; and two millions of men sitting in Poor-Law Bastilles seem to ask of every English soul, "Hast thou no word to say for us?"' When *Past and Present* appeared in 1843, Carlyle's reputation as a thinker, historian, and moral leader was so great, owing to the publication of the *Miscellanies* in 1839 and of the *French Revolution*, that his book had a tremendous effect upon the British public, and soon was exerting an influence in public affairs. Many of the conditions which he sought to improve have so changed as to make parts of the book less vital than others. In its own time, as Emerson said, it was indeed an '*Iliad* of English woes,' and many agreed with him that it was a political tract comparable to nothing of its kind since the days of Burke.

Carlyle's originality is perhaps most evident in his use, in Book II, of *The Chronica Jocelini de Brakelonda*, a manuscript 'seven centuries old,' published by the Camden Society, London, 1840. Unfortunately, the method of Book II is such that no satisfactory isolated passages or chapters are possible here, and the Book must be read entire to be understood and its artistry appreciated. To the mind of Carlyle, who distrusted democracy, it presented a memorable picture of medieval life at the abbey of St. Edmund's Bury, which mirrored life in the outside world as organic, as one in which the serf had his place in the social fabric, and kings really ruled, and reverence and religion made life a unit. In that life, excellence was not ascertained by the ballot-box; the many were governed by the superior few; and the end of life was duty and labor

rather than happiness. Books III and IV have a modern relevancy which few Victorian tracts achieved: they preach the now familiar Carlylean gospel of work, renunciation, obedience to men naturally gifted with leadership, the enormous responsibility of the new leaders, the 'Captains of Industry,' the illusoriness of democracy, and the necessity for the organization of labor.

Past and Present was written rapidly, yet with careful revision, in 1842–3, to ease Carlyle's conscience in a period of extraordinary social and economic misery. 'I found I could not go on with Cromwell,' he wrote, 'till I had disburdened my heart somewhat.' His book became one of the great weapons for social amelioration in the years that followed.

SHOOTING NIAGARA

This is Carlyle's last great attack on what he considered the great illusion, democracy. Froude has well stated the grounds for Carlyle's view: 'For all disorders modern Europe had but one remedy, to abolish the subordination of man to man, to set every individual free, and give him a voice in the government, that he might look after his own interests. This once secured, with free room and no favour, all would compete on equal terms, and might be expected to fall into the places which naturally belonged to them. . . . [But] as the European world actually was, in the actual moral and material condition of European mankind, with no spiritual convictions, no sincere care for anything save money and what money could buy, this notion of universal liberty in Carlyle's opinion could end in nothing save universal wreck.' In the actual moral condition of England, Carlyle believed that with the extension of the franchise, men's rulers would become steadily inferior and more unfit, and would never, in their character and intelligence, rise above the level of those who chose them. In an age weak in faith and moral stamina, men needed leaders of sterling character, integrity, and intelligence. The spread of democracy would only aggravate the modern disease of irresponsibility and Mammon-worship. In 1867 the Tories had just come into power, and at once began to outbid their rivals, 'courting the votes of the mob by the longest plunge yet ventured into the democratic whirlpool.' Carlyle's pamphlet was one response to the Tories' decision. He reminded the aristocracy of its opportunities and responsibilities, and suggested education, military drill, emigration, and other solutions to the problem of the restless masses. *Shooting Niagara* appeared first in *Macmillan's Magazine* for August 1867; it was corrected and republished in September. It was Carlyle's 'last public utterance on English politics.'

The Reform Bill of 1867 became law, and Carlyle's Niagara has not proved to be so dreadful as he predicted. But his pamphlet remains one of the most eloquent and provocative criticisms of the principle of democracy.

JAMES ANTHONY FROUDE (1818–94)

CHRONOLOGY

1818 Born at Dartington, Devonshire, on April 23, brother of Richard Hurrell Froude and William Froude; son of the Venerable R.H.Froude, Archdeacon of Totnes, and Margaret Spedding.

1830–35 Attended Westminster School; received two years of private tutoring at Merton College, Oxford.

1836–44 Matriculated at Oriel College, Oxford (1836); took a second class in the final examinations in 1840; won the Chancellor's English Essay Prize, and a fellowship at Exeter (1842); came under the influence of John Henry Newman, wrote the life of St. Neot for Newman's 'Lives of the English Saints' (1844), and took deacon's orders, which, despite the change in his

religious opinions, he did not renounce until 1872.

1847–52 Came under the influence of such writers as Lessing, Goethe, and Carlyle; published a work of fiction, *Shadows of the Clouds* (1847), then *The Nemesis of Faith* (1849), which marked his breach with orthodoxy; resigned his Exeter fellowship, and surrendered the appointment he had just received as headmaster of the high school at Hobart Town, Tasmania; made the acquaintance of Carlyle, and began the life of a man of letters, contributing to *Fraser's Magazine* and the *Westminster Review*; published *England's Forgotten Worthies* (1852).

1856–75 Published the *History of England* (1856,1870); edited *Fraser's Magazine* (1860–74); was made rector of St. Andrews (1868); published *The English in Ireland in the Eighteenth Century* (1872–74); lectured in the United States (1872); travelled in South Africa (1874–75).

1881–84 As sole literary executor of Carlyle, published Carlyle's *Reminiscences* (1881), the letters of Jane Carlyle (1883), and the life of Carlyle (1882, 1884), arousing bitter controversy over his right to publish all of the documents therein, and over the accuracy and the details of his interpretation of Carlyle's life and character.

1884–88 Made honorary LL.D. at Edinburgh (1884); visited Australia (1884–85); published *Oceana* (1886); visited the West Indies (1886–87), and published *The English in the West Indies* (1888).

1892–94 Made Regius Professor of Modern History at Oxford (1892); published his lectures on the *Life and Letters of Erasmus*; died on October 20, 1894, at Salcombe, Devon.

Posthumously published: *English Seamen in the Sixteenth Century* (1895); *The Council of Trent* (1896).

NOTES

HISTORY OF ENGLAND

EXECUTION OF MARY QUEEN OF SCOTS

'Carlyle's chief disciple and biographer, approaching history in the spirit of his master, accomplished work in which shining merits and glaring faults are inextricably mingled. . . . On beginning to study the sixteenth century for himself Froude was struck by the popularity of Henry VIII during his lifetime. When the plan arose in his mind of a detailed narrative of the struggle of England against Rome, he was warmly encouraged by Carlyle, who had recently scourged the Jesuits in a Latter Day Pamphlet, and regarded the Roman Church as a gigantic imposture. The first four volumes of the "History of England from 1529 to the death of Eliza-

beth" created a sensation only less than that of Macaulay. . . . A born story-teller, [Froude] produces his effects by the simplest methods. The reader voyages without effort over sparkling waters. No English historian has possessed a style so easy, so flowing, so transparent. . . . The later and larger half of the work is devoted to Elizabeth. Artistically, despite many brilliant passages, it is inferior to the earlier volumes. . . . The Scottish scenes of the drama are at once the most brilliant and the least trustworthy. Mary Stuart is pursued with relentless hatred through thirty years. . . . Froude closes the age of the amateurs [in the writing of history], whose brilliant writings belong as much to literature as to history. . . . His great scenes are equal to Macaulay, and Frederic Harrison has compared him to Livy and Froissart.' (G. P. Gooch, *History and Historians in the Nineteenth Century*, pp. 332–39.)

Froude's *History* appeared in 1856–70.

THOMAS HENRY HUXLEY (1825–95)

CHRONOLOGY

I. *Early Years and Education* (1825–46)

1825–41 Born at Ealing, May 4, the seventh child of George Huxley, a senior master of a semi-public school under Dr. Nicholas; attended an 'unreformed public school'; father moved to Coventry, his original home, to become manager of a savings bank (1835), and the period of Thomas's systematic training ended; his education continued, however, in his acquaintances with older persons and in his readings (the readings before his teens include Hutton's *Geology*, Lyell's *Principles of Geology*, and Hamilton's *Logic*); read much of Carlyle, whose works exerted strong influence upon him; began an early and thorough acquisition of German, French, and Italian.

1841–46 Went to Rotherhithe to begin studies in medicine as the assistant of Dr. Chandler (1841), his work bringing him into contact with the very poor, in whom he always remained interested; apprenticed to his brother-in-law, Dr.J.G.Scott; began preparing for matriculation examination at the University of London by hearing lectures at Sydenham College; began his medical course as a Free Scholar at Charing Cross Hospital (Oct., 1842); passed with distinction, receiving a first prize in chemistry and a gold medal in anatomy and physiology; M.B., University of London, 1845.

II. *Scientific Researches; Marriage* (1846–59)

1846–54 Became assistant surgeon on the *Rattlesnake* in the service of the Navy (1846), and sailed to Australian and East Indian seas; made extensive researches on marine animals, despite a lack of proper tools and books to aid him; met Miss Henrietta Anne Heathorn in Sydney, and became engaged to her; returned with *Rattlesnake* to England (1850); spent a three and a half years' leave of absence working on 'The Oceanic Hydrozoa,' published in 1858; applied unsuccessfully for chairs at Toronto, Aberdeen, Cork, and King's College, London; was elected a Fellow of the Royal Society (June 5, 1851); mother died (1852) and Huxley became despondent, but his sister, Lizzie, encouraged him to 'hold fast'; began his career as a lecturer (1852) with a talk on 'Animal Individuality' before the Royal Institute; continued his extensive research, establishing himself as a scientific investigator without rival; contributed regularly to the *Westminster Review* articles on 'Contemporary Science'; was commissioned to write an anatomy manual, etc., earn-

ing about £250 a year by his pen alone.

1854–59 Lecturer in Natural History in the Royal School of Mines at £200 a year (1854), and in the same year became Naturalist to the Geological Survey at the same salary; Lecturer in Comparative Anatomy at St. Thomas's Hospital; a belated grant of £300 from the government came to him; Mr. Heathorn and his daughter arrived in England to live (1855), and Huxley and Henrietta were married two months later (July 21, 1855); continued his perpetual researches even on his honeymoon; gave his first set of 'Lectures to Working Men' (1855), many people posing as working men in order to gain admission; his first son born in 1857; in poor health during 1857, went to Switzerland for his summer holiday, studying and writing papers on glaciers; his researches by this time had included invertebrates, vertebrates, and plants; was instrumental in the establishment of a scientific column in the *Saturday Review* (1858), which later gave rise to the *Natural History Review* (1861–65), and *Nature* (1869); became a Fellow of the Linnean Society, and a member of the Athenaeum Club (1858).

III. *Advocacy of the Scientific Method and Its Findings* (1859–70).

1859–63 Commissioned to review Darwin's *Origin of Species* (1859) for *The Times*; was appointed Secretary to the Geological Society; began his defense of Darwin in a discourse, 'On Species, Races, and their Origin,' before the Royal Institution (1860); had not planned to champion the cause of evolution in the now-famous debate at the British Association, but, drawn into it by Robert Chambers's request, proved himself a debater of first rank; began his championing of higher education for women in a letter to Sir Charles Lyell (1860); suffered indifferent health, and so went to Switzerland with Tyndall to mend; gave series of lectures to working men on evolution, 'On Our Knowledge of the Causes of the Phenomena of Organic Nature' (1862); notes taken down in shorthand by an auditor, published with Huxley's permission, their popularity astonishing him; Darwin read them and was immensely pleased.

1863–70 Published *Man's Place in Nature*, his first book, in 1863, much of which had already been made known to the public by him; was instrumental in the establishment of the *X* Club, the purpose of which was to insure the continued contacts of nine mutually interested scientists: Bust, Frankland, Hirst, Huxley, Hooker, Lubbock, Spencer, Spottiswoode, and Tyndall (1864); prepared an essay, 'Emancipation — Black and White' (1865) after the Civil War in the United States, in which he championed the cause of education of both sexes of both colors; gave support to the International Educational Society (1865); received LL.D. from Edinburgh, along with Carlyle and Tyndall (1866); his love of fair play prompted his becoming a member of the Jamaica Committee (1866), judging the negro Gordon a 'poor type of political agitator' and condemning Governor Eyre for the 'absurd tribunal' and its 'brutal mockery of the forms of justice'; extended his work on birds and reptiles throughout 1867 to 1869; delivered three lectures, 'A Liberal Education,' 'On a Piece of Chalk,' and 'On the Physical Basis of Life' (1868), the last of which evoked criticism by Archbishop Thomson in 'On the Limits of Philosophical Inquiry'; continued his work in the cause of education, making special point of the need for the application of the scientific method, in 'Scientific Education, Notes of an

After-Dinner Speech' (1869), praising the training method of the Roman Catholic Church, and condemning — as a man of science — its teachings; entered the Metaphysical Society, and coined the word *agnostic* to apply to his non-committal attitude toward religious problems; became President of the Geological Society, and President of the Ethnological Society (1869); elected President of the British Association for the following year (1870); because of his increasing work, was forced to resign his professorship at the Royal College of Surgeons (1869).

IV. *Public Works; Educational and Philosophical Writings* (1870–95).

1870–72 Began a great extension of his career as public official and administrator at the expense of original work, serving on no less than six Royal Commissions by 1884, in addition to the four on which he had already served (the commissions concerned medical, educational, and scientific problems); published *Lay Sermons, Addresses and Reviews* (1870), a very popular book which extended his influence as an educationalist; offered himself as candidate for the first London School Board, and was elected (1870); stated his views on school boards in the *Contemporary Review* (1870), advocating physical training, training in domestic economy, ethical and religious training, and intellectual training; Secretary of the Royal Society (1871–81); continued his defense of Darwin with an important article, 'Mr. Darwin's Critics,' in the *Contemporary Review* (Nov., 1871); published his *Manual of the Anatomy of Vertebrated Animals* (1871), a standard text for well over a quarter of a century.

1872–76 The break-down of his health required attention, and, unknown to him, eighteen of his friends enriched his bank account by 2000 guineas, Darwin explaining the gift to him; traveled to Egypt and Italy, enjoying himself thoroughly, but with slight improvement to his health; returned to England; was elected Lord Rector of the University of Aberdeen (1872); traveled with Hooker in France (1873), and recovered his health — and extended his study of glaciers; learned smoking from Hooker, who advised it as a therapeutic measure against gastric disturbance; delivered the Rectorial Address, 'Universities: Actual and Ideal,' at Aberdeen (1874).

1876–78 Visited America to give an address at the Johns Hopkins University ('Address on University Education,' Sept. 12, 1876), remained to give talks elsewhere (published in *American Addresses*, 1877); as a member of the Scottish Universities Commission, went three times to Edinburgh; manifested interest in technical education influencing the establishment of Cowper Street Schools, and the Central Institution of the City and Guilds of London, 1881.

1878–80 LL.D., Dublin University; wrote a book on *Hume* (E.M.L.) at the request of John Morley, editor, in 1878; was elected a Governor of Eton (1879); LL.D., Cambridge.

1880–84 Delivered 'Science and Culture,' the opening address at Sir Josiah Mason's Science College at Birmingham (1880); was appointed Inspector of Fisheries (1881) at a salary of £700 a year; became Professor of Biology, and Dean in the Union of the Royal School of Mines and Normal School at a salary of £800 a year; was greatly affected by the deaths of Darwin and Balfour (1882); wrote the address 'On Science and Art in Relation to Education' (1882); was elected President of the Royal Society (1883) upon the death of Spottiswoode.

1884–88 Went to Italy because of poor health (1884); returned to England

(1885), and resigned his professorship and his Inspectorship of Fisheries in order to relieve the strain upon him; received government retiring allowances totaling £1500 a year; D.C.L., Oxford (1885); health began to return; engaged in public dispute with Gladstone in the *Nineteenth Century* on the question of science and religion; chronically ill, went to Switzerland (1886); expressed violent opposition to Home Rule in a letter in *The Times* (1886); developed pleurisy (1887) and returned to Switzerland; wrote 'Scientific and Pseudo Scientific Realism' (*Nineteenth Century*, 1887), which began a series, collected in 1893 under the title, *Science and Christian Tradition*, and which evoked a small argument with the Duke of Argyll, causing Huxley to write 'Science and Pseudo Science,' and 'Science and the Bishops.'

1888 90 Was driven to Switzerland by a second attack of pleurisy (1888); received the Copley Medal of the Royal Society upon his return; wrote four articles in the *Nineteenth Century* (1888–89) in reply to Dr. Wace's attack upon agnosticism in the same periodical; wrote his 'Autobiography' (1889) for Louis Engel.

1890–93 Wrote a series of essays on political philosophy for the *Nineteenth Century*: 'The Natural Inequality of Man,' 'Nature and Political Rights,' 'Capital, the Mother of Labour,' 'Government: Anarchy or Regimentation'; was drawn again into controversy, replying to Gladstone's fresh outburst by the article, 'The Keepers of the Herd of Swine'; wrote a preface to the French translation of some of his essays on education (1891).

1893–95 Delivered a lecture, 'Evolution and Ethics,' at Oxford (1893), just after a recovery from influenza; received the Darwin Medal (1894); recurring illnesses developed into influenza and bronchitis which proved fatal, June 29, 1895.

COMMENTARY

'The many-sided character of Huxley's work renders it singularly difficult to form a just conception of his position among the great men of his day, and the estimate must necessarily differ according to the point of view. Only a symposium of specialists could do him full justice. . . . A careful review of Huxley's written works brings out one very striking point, the comparatively early age at which intellectual maturity was attained. . . . And when, in his closing years, he edited his *Collected Essays*, surprisingly little was found to alter. . . .

'In regard to Huxley's purely scientific research it will be sufficient to say here that a great deal of it was not only valuable but epoch-making. He left his mark on almost every important group of the animal kingdom. . . .

'Only second to his work as a professional scientist and champion of Darwinism, come Huxley's manifold labours in the cause of education. . . . His influence on elementary education was immense, and secondary instruction is also greatly indebted to him. Nor must we forget his labours in the cause of medical and technical education. In all cases his attention was primarily directed to main principles. . . .

'Of Huxley's contributions to critical theology, highly controversial for the most part, as he himself regretfully admitted, enough has elsewhere been said. Here and there they are perhaps a little too strongly illuminated by flashes of withering wit and biting sarcasm, and he would seem to have underrated the capacity of some of his opponents, Mr. Gladstone more particularly. The "scratches" he inflicted were sometimes more serious than "flesh wounds." But his unsurpassable powers of debate, and his thorough knowledge of authorities, gave him in all

cases an undeniable advantage. And we largely owe to him in this country that freedom of speech in matters theological without which progress would be indefinitely postponed.

'The work of Huxley's life, carried on with unflagging zeal and undiminished powers almost to the day of his death, is a symmetrical and finished whole. Beginning with primeval protoplasm, the "physical basis of life," it ranges through the long perspectives of the animal kingdom to man as the noblest outcome of organic evolution. To man as an individual, to thinking man as a member of an organized society, and to man as "Nature's rebel," with deeply implanted ethical and religious sentiments, waging continual war against the stern realities of the cosmic process.

'Huxley's researches as a comparative anatomist and embryologist would alone entitle him to a conspicuous place among his contemporaries. And when to this we add his championship of evolution, his labours in the cause of education, his contributions to sociology and ethics, he stands, an unique figure, among those who brought about that Scientific Renascence for which the Nineteenth Century will be memorable as long as the human race endures.' (J.R.Ainsworth Davis, *Thomas H. Huxley*, 1907, pp.242–53.)

NOTES

LAY SERMONS

'The publication in 1870 of *Lay Sermons*, the first of a series of similar volumes, served, by concentrating his moral and intellectual philosophy, to make his influence as a teacher of men widely felt. The "active scepticism," whose conclusions many feared, was yet acknowledged as the quality of mind which had made him one of the clearest thinkers and safest scientific guides of his time, while his keen sense of right and wrong made the more reflective of those who opposed his conclusions hesitate long before expressing a doubt as to the good influence of his writings.' (Leonard Huxley, *Life and Letters of Thomas Henry Huxley*, New York, 1901, I, 347.) This book has always been his most popular volume of essays (see *ibid.*, I, 353).

ON THE PHYSICAL BASIS OF LIFE

Huxley's own note on the title of this essay reads: 'The substance of this paper was contained in a discourse which was delivered in Edinburgh on the evening of Sunday, the 8th of November, 1868 — being the first of a series of Sunday evening addresses upon non-theological topics, instituted by the Rev.J.Cranbrook. Some phrases, which could possess only a transitory and local interest, have been omitted; instead of the newspaper report of the Archbishop of York's address, his Grace's subsequently-published pamphlet "On the Limits of Philosophical Inquiry" is quoted [not included in the present abridgment]; and I have, here and there, endeavoured to express my meaning more fully and clearly than I seem to have done in speaking — if I may judge by sundry criticisms upon what I am supposed to have said, which have appeared. But in substance, and, so far as my recollection serves, in form, what is here written corresponds with what was there said.'

It was printed in the *Fortnightly Review*, Feb. 1, 1869; in 1870 it appeared as one of the essays in Huxley's *Lay Sermons, Addresses, and Reviews*, many times reprinted; and Huxley finally included it in *Methods and Results* (1893), the first volume of his *Collected Essays*. In his prefatory letter to Professor Tyndall, Huxley wrote: '. . . the essay "On the Physical Basis of Life" was intended to contain a plain and untechnical statement of one of the great tendencies of modern biological thought, accompanied by a protest, from the philosophical side, against what is commonly called Materialism. The result of my well-meant efforts I find to be, that I am generally credited

with having invented "protoplasm" in the interests of "materialism." My unlucky "Lay Sermon" has been attacked by microscopists, ignorant alike of Biology and Philosophy; by philosophers, not very learned in either Biology or Microscopy; by clergymen of several denominations; and by some few writers who have taken the trouble to understand the subject. I trust that these last will believe that I leave the essay unaltered from no want of respectful attention to all they have said.' (*Lay Sermons*, 1870, p.vii.)

DARWINIANA

[THE METHOD OF SCIENTIFIC INVESTIGATION]

This passage is an excerpt from the third lecture in Huxley's 'On Our Knowledge of the Causes of the Phenomena of Organic Nature,' as published in *Darwiniana* (1893), the second volume of Huxley's *Collected Essays*. In 1855 Professor Huxley began delivering regular courses of lectures to working men, artisans. His son asserted that these voluntary lectures 'impressed those qualified to judge as surpassing even his class lectures.' He wrote, in that year, that he was 'sick of the dilettante middle class,' and intended to try what he could do 'with these hard-handed fellows who live among facts.' Year after year he devoted careful energy to these lectures. In preparing his series for November-December, 1862, he wrote to Darwin that the one subject for him to talk about at that time was *On the Origin of Species*. He delivered his six lectures, accordingly, using the general title given above. Each was published as a little pamphlet. In this form they had a large sale; and they played their part in Huxley's important expounding of, and advocating the acceptance of, Darwin's great theories. (*Cf.* Leonard Huxley, *Life and Letters of Thomas Henry Huxley*, New York, 1901, I, 149,222–24.)

SCIENCE AND EDUCATION

A LIBERAL EDUCATION; AND WHERE TO FIND IT

This essay was Huxley's 'Inaugural Address' as Principal of the South London Working Men's College, delivered to that college on January 4, 1868. It was published in *Macmillan's Magazine*, March, 1868, and across the Atlantic was reprinted in the issue for April 11, 1868, of the Boston weekly *Every Saturday* (V, 466–73). In 1870 it was printed in *Lay Sermons*, and Huxley included it in *Science and Education* (1893), the third volume of his *Collected Essays*. The essay is of enduring interest for its substance. Its clear style, moreover, is admirable; and the style enhances the effect of two famous passages in it, one on life as a game of chess, the other on the sort of man who 'has had a liberal education.'

SCIENCE AND CULTURE

This essay (a few introductory paragraphs from the beginning of it are omitted in this reprint) was delivered as an address at the opening of Sir Josiah Mason's Science College, at Birmingham, on October 1, 1880. It was printed in *Science and Culture, and Other Essays* (1881), and in *Science and Education* (1893), the third volume of *Collected Essays*. This essay should be compared, of course, with Matthew Arnold's 'Literature and Science.'

SCIENCE AND CHRISTIAN TRADITION

AGNOSTICISM AND CHRISTIANITY

The present reprint is an excerpt from the essay 'Agnosticism and Christianity,' first printed in the *Nineteenth Century*, June, 1889, and later published in *Essays on Some Controverted Questions* (1892), and in *Science and Christian Tradition* (1894), the fifth volume of *Collected Essays*. Dr. Wace, the Principal of King's College, London, had attacked Huxley's

attitude of agnosticism, saying that those who called themselves agnostics were using a 'mere evasion,' and that they should be called infidels. This attack had been followed up by articles, written by Laing and Harrison, in the *Nineteenth Century*. Roused to reply, Huxley wrote four articles for the *Nineteenth Century*; 'Agnosticism and Christianity' was the last of them. His son wrote: 'There was a humorous aspect of this article which tickled his fancy immensely, for he drove home his previous arguments by means of an authority whom his adversaries could not neglect, though he was the last man they could have expected to see brought up against them in this connection — Cardinal Newman.' (Leonard Huxley, *op. cit.*, II, 230,240.) The excerpt is of interest also as presenting Huxley's explanation of the term 'agnosticism.'

THOMAS BABINGTON MACAULAY (1800–59)

CHRONOLOGY

I. *Early Years and Pre-Parliamentary Career* (1800–30)

1800 Born at Rothley Temple, Leicestershire, on October 25; son of Zacharay Macaulay (philanthropist, abolitionist, editor of the *Christian Observer*, and chief of the Evangelical 'Clapham Sect') and Selina Mills.

1807–14 Showed great precocity, planning at eight years of age a *Compendium of Universal History*; wrote three cantos of *The Battle of Cheviot*, in the manner of Scott's metrical romances, a long poem on Olaus Magnus, and a blank-verse poem on *Fingal*; early showed his astonishing memory, which was to serve him well throughout life; was sent in 1812 to a private school at Little Shelford, and in 1814 to Aspenden Park in Hertfordshire.

1818 Entered Trinity College, Cambridge, where he plunged into reading widely, and talking brilliantly among his friends, Derwent and Henry Nelson Coleridge, Praed, Charles Austin, and the men who later became Lord Grey, Lord Belper, and Lord Romilly; participated in the debates of the Cambridge Union; favored Catholic Emancipation, Free Trade, Utilitarianism; for a time was attracted to Radicalism, under the influence of Charles Austin; gained the Chancellor's Medal for English Verse (1819,1821), a prize for a Latin declamation, and a Craven Scholarship; became fellow of Trinity (1824); left college imbued with Whig principles.

1825 Contributed his first essay, on Milton, to the *Edinburgh Review*, striking a new and bracing note in criticism and in style; soon became known as a brilliant talker, and was admitted to the great Whig circles.

1826–29 Called to the bar; joined the northern circuit, but had little success; continued to offer his literary power to the Whigs: reviewed Hallam's *Constitutional History* (1828) and struck at the Tories of his own day through the 17th-century Cavaliers; attacked the doctrinaire Utilitarians and left-wing Radicals through his review of James Mill's *Essay on Government* (1829); reviewed Southey's *Colloquies* (1830), and clearly defined and gave new lease to the Whig position and to the middle class's demand to enter the pale of the constitution.

1829 Became Commissioner of Bankruptcy at £400 a year; was obliged to give financial aid to his father, whose fortune had been lost; declined the editorship of the *Edinburgh Review* because of the location of the headquarters.

II. *Parliamentary Career: Essays, Poems, History* (1830–47)

1830 Became M.P. for the 'pocket borough' of Calne (Whig), offered by

Lord Lansdowne; made his maiden speech on April 5 at a re-reading of the Bill for the Removal of Jewish Disabilities; visited Paris, on the death of George IV and the dissolution of Parliament, observing the July revolution; again M.P. for Calne.

1831 Established his reputation as a parliamentarian on March 1, in his speech advocating the passage of the Reform Bill; highly praised for his skill and power by Sir Robert Peel, the leader of his foes; enjoyed still greater social success in high Whig society, with Lord Grey, Samuel Rogers, Lady Holland; wrote in every spare moment, rising sometimes at 5 a.m. to write a review before breakfast.

1832 Deprived of his seat for Calne by the passage of the Reform Bill, which he had supported; became Commissioner on the Board of Control, and applied himself to the study of Indian affairs.

1833 Became one of the two members of the new middle-class borough of Leeds.

1834–37 In India, served on the Supreme Council, at £10,000 a year; applied liberal and enlightened principles to Indian affairs: brought about liberty of the press, legal equality of natives and Europeans, a system of national education; became president of a commission to investigate Indian jurisprudence, and submitted the draft of a penal code which became the basis of the present Indian criminal code; continued his enormous program of reading: English, French, Italian, Spanish, Portuguese, Greek, and Latin literature, Mill's *India*, Bacon's *De Augmentis*, etc.; collected materials for the essays on Clive and Hastings; wrote the essay on Bacon, showing the practical and utilitarian basis of the Whig reformer; saved some £30,000 from his salary, fell heir to £10,000 from an Anglo-Indian uncle, and returned to England in 1838, financially independent.

1838–47 Back in politics, wrote the first lines of his *History*, March 9, 1839; entered the House as Liberal member for Edinburgh, June 1839; became Secretary-at-War in Melbourne's cabinet three months later; toured Italy for his health, which was now beginning to fail; became more than ever a literary lion; published *Lays of Ancient Rome* (1842), and the *Essays* (1843), which, as a volume, gained instant and wide popularity; assisted materially in the passage of the Copyright Bill (1842); became Paymaster-General under Lord John Russell (1846), but in the 1846–47 sessions of Parliament spoke only five times, deeply absorbed in the writing of the *History*; lost his seat for Edinburgh (1847); retired from public life to devote himself to literature.

III. *Last Years: The History of England* (1847–59)

A time of pleasant and unflagging literary labor; of endless talk with the great and prominent; of supreme popularity and leadership in the realm of letters.

1848 Published (Nov.) volumes I and II of the *History of England* (dated 1849), which met with a reception beyond all expectation, selling 13,000 copies by March 1849 (40,000 copies sold in America).

1849 Became Lord Rector of the University of Glasgow; declined the Regius Chair of History at Cambridge.

1852 Refused a Cabinet post when his party returned to office; was returned to Parliament for Edinburgh, though neither visits nor pledges had been promised; discovered serious heart trouble.

1855 Published volumes III and IV of the *History*, which completed Macaulay's success.

1856 Quitted the Albany, where he had lived since 1841, and settled at Holly Lodge, Campden Hill, where he hoped

to bring the *History* down through 1700.

1857–58 Raised to the peerage, with the title of Baron Macaulay of Rothley (1857); suffered increasingly from poor health; contributed to the *Encyclopædia Britannica* articles on Atterbury, Bunyan, Goldsmith, Doctor Johnson, and William Pitt.

1859 Died on December 28; buried in Westminster Abbey on January 9, 1860.

COMMENTARY

'The purists in style shake their heads over [Macaulay's] everlasting antitheses, the mannerism of violent phrases and the perpetual abuse of paradox. His most indulgent friends admit the force of these defects, which they usually speak of as his "limitations" or his "methods." Here, indeed, is an opportunity for one of those long-drawn antitheses of which Macaulay was so great a master. How he would himself have revelled in the paradox, — "that books which were household words with every cowboy in Nevada, and every Baboo in Bengal, were condemned by men of culture as the work of a Philistine and a mannerist"; "how ballads which were the delight of every child were ridiculed by critics as rhetorical jingles that would hardly win a prize in a public school"; "how the most famous of all modern reviewers scarcely gave us one example of delicate appreciation or subtle analysis"; how it comes about "that the most elaborate of modern histories does not contain an idea above the commonplaces of a crammer's text-book," — and so forth, in the true Black-and-White style which is so clear and so familiar. But let us beware of applying to Macaulay himself that tone of exaggeration and laborious antithesis which he so often applied to others. Boswell, he says, was immortal, "*because* he was a dunce, a parasite, and a coxcomb." It would be a feeble parody to retort that Macaulay became a great literary power "*because* he had no philosophy, little subtlety, and a heavy hand." For my part, I am slow to believe that the judgment of the whole English-speaking race, a judgment maintained over more than half a century, can be altogether wrong; and the writer who has given such delight, has influenced so many writers, and has taught so much to so many persons, can hardly have been a shallow mannerist, or an ungovernable partisan. No one denies that Macaulay had a prodigious knowledge of books; that in literary fecundity and in varied improvisation he has rarely been surpassed; that his good sense is unfailing, his spirit manly, just, and generous; and lastly, that his command over language had unequalled qualities of precision, energy, and brilliance. These are all very great and sterling qualities. And it is right to acknowledge them with no unstinted honour, — even whilst we are fully conscious of the profound shortcomings and limitations that accompanied but did not destroy them.

'In a previous paper we discussed the permanent contribution to English literature of Thomas Carlyle; and it is curious to note how complete a contrast these two famous writers present. Carlyle was a simple, self-taught, recluse man of letters: Macaulay was legislator, cabinet minister, orator, politician, peer, — a pet of society, a famous talker, and member of numerous academies. Carlyle was poor, despondent, morbid, and cynical: Macaulay was rich, optimist, overflowing with health, high spirits, and good nature. The one hardly ever knew what the world called success: the other hardly ever knew failure. Carlyle had in him the elements that make the poet, the prophet, the apostle, the social philosopher. In Macaulay these were singularly wanting; he was the man of affairs, the busy politician, the rhetorician, the eulogist of society as it is, the believer in material progress, in the ultimate triumph of all that is practical and commonplace, and in the final discomfiture of all that is visionary and utopian. The Teufelsdröckhian

dialect is obscure even to its select students: the Macaulay sentence is plain as that of Swift himself. Carlyle's gospel is full of passion, novelty, suggestion, theory, and social problems. Macaulay turned his back on social problems and disdained any kind of gospel. He had no mission to tell the world how bad it is; on the contrary, he was never wearied with his proofs that it ought to be well satisfied with its lot and its vast superiority in all things to its ancestors. . . . In one thing all agree,—critics, public, friends, and opponents. Macaulay's was a life of purity, honour, courage, generosity, affection, and manly perseverance, almost without a stain or a defect. His life, it was true, was singularly fortunate, and he had but few trials, and no formidable obstacles. He was bred up in the comfortable egoism of the opulent middle classes; the religion of comfort, *laissez-faire*, and social order was infused into his bones. But, so far as his traditions and temper would permit, his life was as honourable, as unsullied, and as generous, as ever was that of any man who lived in the fierce light that beats upon the famous. We know his nature and his career as well as we know any man's; and we find it on every side wholesome, just, and right. . . .

'[Macaulay's style] is perfectly pellucid in meaning, rings on the ear like the crack of a rifle, is sonorous, rich, and swift. One can fancy the whole passage spoken by an orator; indeed it is difficult to resist the illusion that it was "declaimed" before it was written. We catch the oratorial tags and devices, the repeated phrase, the incessant antithesis, the alternate rise and fall of eloquent speech. It is declamation — fine declamation — but we miss the musical undertones, the subtle involutions, the unexpected bursts, and mysterious cadences of really great written prose. . . . The artificial structure of his paragraphs grew upon Macaulay with age. His *History of England* opens with a paragraph of four sentences. Each of these begins with "I purpose," "I shall"; and the last sentence of the four has ten clauses each beginning with "how." The next paragraph has four successive sentences beginning "It will be seen," — and the last sentence has again three clauses each beginning with "how." The fourth paragraph contains the word "I," four times in as many lines. This method of composition has its own merits. The repetition of words and phrases helps the perception and prevents the possibility of misunderstanding. Where effects are simply enumerated, the monotony of form is logically correct. Every successive sentence heralded by a repeated "how," or "there," or "I," adjusts itself into its proper line without an effort of thought on the reader's part. It is not graceful; it is pompous, and distinctly rhetorical. But it is eminently clear, emphatic, orderly, and easy to follow or to remember. . . . The style, with all its defects, has had a solid success and has done great things. By clothing his historical judgments and his critical reflections in these cutting and sonorous periods, he has forced them on the attention of a vast body of readers wherever English is read at all, and on millions who have neither time nor attainments for any regular studies of their own. How many men has Macaulay succeeded in reaching, to whom all other history and criticism is a closed book, or a book in an unknown tongue! If he were a sciolist or a wrong-headed fanatic, this would be a serious evil. But, as he is substantially right in his judgments, brimful of saving common-sense and generous feeling, and profoundly well read in his own periods and his favourite literature, Macaulay has conferred most memorable services on the readers of English throughout the world. He stands between philosophic historians and the public very much as journals and periodicals stand between the masses and great libraries. Macaulay is a glorified journalist and reviewer, who brings the matured results of scholars to the man in the street in a form that he can remember and enjoy, when he could not make use of a merely

learned book. He performs the office of the ballad-maker or story-teller in an age before books were known or were common. And it is largely due to his influence that the best journals and periodicals of our day are written in a style so clear, so direct, so resonant. We need not imitate his mannerism; we may all learn to be outspoken, lucid, and brisk. . . .

'Macaulay, who was no braggart, has put it on record that his conception of history was more just than that of Hume, Robertson, Voltaire, and Gibbon. It is perfectly true that his conception was different from theirs, his execution was different, and he does not address the same class of readers. But his conception of history was not just; it was a mistake. His leading idea was to make history a true romance. He has accomplished this; and he has given us *a historical novel drawn from authentic documents*. This is, no doubt, a very useful thing to do, a most interesting book to read; it is very pleasant literature, and has a certain teaching of its own to a certain order of readers. But it is not *history*. It sacrifices the breadth of view, the organic life, the philosophy, the grand continuity of human society. It must be a sectional picture of a very limited period in a selected area; it can give us only the external; it inevitably tends to trivial detail and to amusing personalities; it necessarily blinds us to the slow sequence of the ages. Besides this, it explains none of the deeper causes of movement; for, to make a picture, the artist must give us the visible and the obvious. History, in its highest sense, is the record of the evolution of humanity, in whole or in part. To compose an historical novel from documents is to put this object aside. History, said Macaulay in his *Hallam*, "is a compound of poetry and philosophy." But in practice, he substituted word-painting for poetry, and anecdote for philosophy. His own delightful and popular *History of England* is a compound of historical romance and biographical memoir.

'Macaulay's strong point was in narrative, and in narrative he has been surpassed by hardly any historian and even by few novelists. Scott and Victor Hugo have hardly a scene more stirring than Macaulay's death of Charles II., Monmouth's rebellion, the flight of James II., the trial of Titus Oates, the inner life of William III. This is a very great quality which has deservedly made him popular. . . .'

— Frederic Harrison, 'Lord Macaulay,' *Studies in Early Victorian Literature*, London,1895, pp.65–67,68,75–77,83,84–86.

NOTES

MILTON

This essay was occasioned by the reviewing of Milton's *Treatise on Christian Doctrine*, discovered in 1823, and edited and published by R.Sumner in 1825. Lord Jeffrey, editor of the *Edinburgh Review*, appealed to a friend for 'some clever young man who would write for us,' and in August 1825, Macaulay's essay appeared, to the admiration and amazement of its readers. At the age of twenty-five, Macaulay had won himself a place in the literary world. What struck most readers at once was the remarkably early maturity of his powers, and his emphatic and vivid style. In spite of much questionable literary criticism, the essay remains one of Macaulay's best, owing largely to his brilliant, exaggerative treatment of the Puritans and Cavaliers, the suggestive allusions and comparisons, the provocative propositions regarding poetry, science, and civilization, and the general informative power of the whole which was to distinguish all his essays and to give them a wide popular appeal.

SOUTHEY'S COLLOQUIES

In this essay Macaulay reviews Robert Southey's *Sir Thomas More: or, Colloquies on the Progress and Prospects of Society* (London, 1829). Its value in the study of Macaulay and his times lies in its forthright statement of the creed of the rising middle-class liberals, as against the conservative or Tory point of view, and its expression of that optimism which was to characterize the early and mid-Victorian decades. Together with the essay on Bacon, this discussion of Southey provides an interesting statement of the tenets of Whiggism, which has been briefly defined by J. Cotter Morison: 'What, after all, is the essence of Whiggism . . . ? Is it not this: illogical but practical compromise between two extremes which are logical but not at all practical? . . . Wherever men are engaged in steering between the opposite shoals of extreme parties with a view to practical result, there Whiggism exists in reality if not in name. Bossuet was a Whig in the Catholic Church, and Pascal was a Whig in the Gallican Church. Reid, Brown, and Coleridge, and even Kant, were Whigs in philosophy. . . . Macaulay was reviled by Chartists and Churchmen, and he himself disliked high Tories and philosophical Radicals in equal measure.' Many ironies have punctuated the history of liberalism in the nineteenth and twentieth centuries, but Macaulay's early and optimistic exposition of it remains one of the classic expressions of a dream that still persists.

Macaulay's liberalism may profitably be contrasted with the 'illiberalism' of Ruskin, and with the teachings of Carlyle and Newman. As an exponent of middle-class liberalism, he readily embodies a good deal

of the Philistine later chastised by Matthew Arnold.

The essay on *Southey's Colloquies* appeared in the *Edinburgh Review* for January 1830.

SAMUEL JOHNSON

Macaulay reviewed Croker's edition of Boswell's *Life of Johnson* in the *Edinburgh Review* for September 1831. The first section of the review was devoted to an attack on Croker, whom Macaulay had frequently opposed in debate, and who had fought steadily against political reform. This first section has been omitted from the present collection; it consists of an enumeration of errors, criticism of arrangement, and disagreement with Croker's comments. The essay as most of us know it really begins with the paragraph in which 'Boswell is the first of biographers; he has no second.' More than any other of Macaulay's essays, this one has built up the legend of Macaulay the exaggerator. There is little to be said in defense of the method he employed, save that from the point of view of literary art it is unforgettably vivid, irresistible in its rhetorical flow, and entirely successful as a piece of portraiture in the 'Macaulay manner.' We may not agree with his picture of Johnson, or his reading of Boswell's character, or his delineation of Johnson's age; but few of us can deny the power of Macaulay's appeal to the eye, or the perfection of his dramatic, black-and-white technique.

In spite of the controversy occasioned by his essay, Macaulay never changed his opinions. He reprinted the essay with virtually no alterations; and in 1856, when he wrote a second essay on Johnson, for the *Encyclopædia Britannica*, he drew practically the same picture of Johnson and Boswell.

JOHN BUNYAN

This essay was a review of Southey's edition of *Pilgrim's Progress* in 1830, and appeared in the *Edinburgh Review* in December of that year. It is the only essay in which Macaulay attempts to fill the role of literary critic. He refused to review works of poetry for the *Edinburgh Review*, and declared that critical works like Lessing's *Laokoon* and Goethe's remarks on *Hamlet* filled him with 'wonder and despair.' In writing on Bunyan, Macaulay was on very familiar ground, transported to an age in which he felt peculiarly at home. Most of the essay is safely concerned with the narrative content of Bunyan's book, and with some analysis of Bunyan's mind and experience. As in all his essays, Macaulay is here lucidly informative, and effective by virtue of unrelenting emphasis.

FRANCIS BACON

Basil Montagu's sixteen-volume edition of the works of Bacon, published in London in 1825–34, provided Macaulay with an opportunity to analyze one of the great figures of an age he admired, and to set forth the practical and utilitarian side of his liberalism. The first part of the essay, omitted from our collection, deals with Montagu's shortcomings as editor and biographer, and with Bacon's character and achievement. Many readers have violently disagreed with Macaulay's estimate of Bacon; and Spedding, the Victorian authority on Bacon's life and works, revealed that neither Montagu nor Macaulay had presented the subject either accurately or justly. The value of the essay today lies mostly in its second half, where Macaulay bluntly and often pugnaciously expresses his belief in the advantages of material improvement. His standpoint was that of numerous early Victorians eager to brush aside all that lay in the way of immediate social and economic progress, and willing to discount much of the 'impractical' in the heritage of the past. In this essay, Macaulay gives voice to the Whig passion for the attainable, the concrete, the workable. 'No man,' wrote Morison, 'was ever less a philosopher, or more a politician, than Macaulay. He had an eye to business,

not to abstract truth.' His attack on idealism shocked and affronted many of his readers, and it definitely injured his fame as a serious thinker. But his attack was carefully composed and represented what he actually believed: 'there is not a sentence in the latter half [of the essay],' he said, 'which has not been repeatedly recast.' His essay appeared in the *Edinburgh Review* for July 1837, and is still one of the most eloquent statements of a point of view which is perennially with us.

LORD CLIVE

This universally and justly popular essay was published in the *Edinburgh Review* of January 1840, as a review of Sir John Malcolm's *Life of Robert Clive* (3 vols. London, 1836). 'In [it] we find no Attic severity of diction, but all the pomp and splendour of Asiatic eloquence, [which] is not unsuitable to the occasion, a somewhat gorgeous magnificence [being] not out of place in the East. . . . [It] belongs, it need not be said, to his second and better manner; the rhetoric, though proud and high-stepping enough, is visibly under restraint and amenable to the curb. . . . [Warren Hastings and Lord Clive] were men whose characters [Macaulay] could thoroughly understand and largely admire [for] their great civic and military qualities — resolute courage, promptitude, self-command, and firmness of purpose.' (J.C. Morison, *Macaulay*, pp.82–83.)

For the convenience of the reader unfamiliar with the pronunciation of Indian names and other expressions, the following is a list of the principal terms (mostly geographical) which appear in the essay on Clive, together with pronunciation and brief definition:

Arcot (är kŏt′): a town and district a few miles west of the settlement of Madras.

Ava (ä′vȧ): a city in upper Burma, the country east of Bengal.

Bahar, or Behar, Bihar (bĕ här′): a district north of what is modern Orissa.

Benares (bĕn ä′ rēz): a city and district in what is now the United Provinces of Agra and Oudh in British India; the city is on the Ganges river.

Bengal (bĕn gôl′): the district in the north-eastern part of India, west of Assam, on the northernmost tip of the Bay of Bengal; its capital is Calcutta.

Bengalee (rhymes with *squally*).

Berar (bā rär′): a region in central India, once administered by the British under certain agreements with the Nizam of Hyderabad.

Cabul, or Kabul (kä′bo͞ol): a region and city in Afghanistan.

Candahar, or Kandahar (kŭn′ dȧ här′): a city in south Afghanistan, formerly the center of Afghanistan's power.

Carnatic (kär nät′ ĭk): a district in southern India, now in the Madras presidency.

Chandernagore (chŭn′ dēr nȧ gōr′): a French settlement on the Hooghly river, twenty-two miles north of Calcutta.

Chingleput (chĭn′ g'l pŭt′): a settlement on the Coromandel coast, about thirty-five miles south-west of the settlement of Madras.

Chinsura (chĭn sōō′rä): a town in the Hooghly district.

Chorasan, or Khorasan (kō rȧ sän′): a province in north-east Persia.

Comorin (kŏm′ ô rĭn): the southern tip, or cape, of India.

Conjeveram, or Conjeeveram (kŏn jē vēr ŭm′): a town in what is now the Chingleput district of the Madras presidency.

Coromandel (kŏr ô măn′ dĕl): southern extent of the coast of what is now the Madras presidency.

Cossimbuzar, or Kasimbazar (käs ĭm bȧ zär′): a town on the Hooghly river, north of Calcutta.

Deccan, or Dekkan (dĕk′ ȧn): south-central India, between the Narbada and the Kistna rivers.

Delhi (rhymes with *Nelly*): a city in the northern part of India, old capital of the Mogul empire.

Ghizni, or Ghazni (gŭz′ nē): a city in Afghanistan, captured by the British on July 23, 1839.

Gualior, or Gwalior (gwä′ lē ôr): a native state in central India; also an important town in that state.

Guzerat, or Gujarat (gōō̆j ä rät′): a region in western India, north of the Narbada river.

Hoogley, or Hooghly (hōōg′ lī): a branch of the Ganges river; Calcutta is on it.

Hydaspes (hī dăs′ pēz): name of the Jhelum (jā′ lŭm) river, flowing through Kashmir, the Punjab, etc.

Hyderabad (hī dēr ä bäd′): the native state, Deccan; also its capital.

Indus (ĭn′ dŭs): river, 2,000 miles long, which rises in Tibet, and flows through Kashmir, the Punjab, etc., and into the Arabian sea.

Jaut, or Jat (jät): dweller in the Punjab, Rajpootana, etc.

Jumna (jŭm′ nä): a river, 860 miles long, rising in the Himalaya mountains and flowing to the Ganges in eastern India.

Khan (kän, kăn): title equivalent to *Lord* or *Prince*.

Lucknow (lŭck′ nou [second syllable rhymes with *how*]): a city and district in north-east India, now in the United Provinces of British India.

Madras (mȧ drȧs′): a maritime city, and the region known as Madras; the latter extends from Orissa south along the coast of the Indian peninsula and inland to Hyderabad and Mysore.

Mahratta (mȧ răt′ ȧ) (variant of Maratha): member of the race dwelling in the Deccan and in the Bombay region

Mogul (mō gŭl′): one of the Mongol conquerors of India, or one of their descendants.

Moorshedabad, or Murshidabad (mōōr′ shĕd ä bäd′): a town in Bengal about 115 miles north of Calcutta.

Nazir (nä′ zĭr): a native court official who serves processes, acts as treasurer, etc.

Nizam (nĭ zäm′, or nĭ zăm′): the title in use since 1713 by the native sovereigns of Hyderabad.

Orissa (ô rĭs′ ȧ): a state in the north-eastern part of the Indian peninsula.

Oude, or Oudh (rhymes with *loud*): a region in the north-eastern part of the Indian peninsula, north-west of Bengal.

palanquin (păl ăn kēn′): a closed conveyance, usually for one person, borne on the shoulders of men.

Patna (pŭt′ nȧ): a city in the north-western part of what was Bengal in Macaulay's time; now the capital of the division of Bihar and Orissa.

Plassey (plăs′ ē): a town about eighty miles north of Calcutta.

Pondicherry (pŏn′ dĭ shĕr′ ĭ): French settlement about a hundred miles south of the settlement of Madras.

Poonah (pōōn′ ȧ): a district in central Bombay; also the capital of the district.

Rajpootana (räj′ pōō tä′ nȧ): 'country of the Rajputs [dominant military caste]' in north-west India.

Rohilcund, or Rohilkand (rō hĭl kŭnd′): a region almost coincident with the modern division of Bareilly, in north-east India.

Sahib (sä′ ĭb): a title equivalent to *Master*.

Seik (rhymes with *seek*, and is a variant of Sikh): a member of a Hindu sect founded in the Punjab about 1500, which developed a powerful military organization.

Tanjore (tăn jōr′): a city and district in what is now the Madras presidency; also the city, the last capital of the ancient Hindu dynasty of the Cholas, held by the Mahrattas until 1799, when it was ceded to the British East India Company.

Travancore (trăv′ ȧn kōr′): a region in the southern tip of India.

Trichinopoly (trĭch′ ĭ nŏp′ ô li): a town some two hundred miles south-west of the settlement of Madras.

FREDERIC THE GREAT

'In King Frederic the Second of Prussia Macaulay's pen had an ideal subject, and it is not wonderful if this Essay is among the best known of the whole collection. . . . [Frederic's] career was full of strange vicissitudes, reverses like Kolin and Kunersdorf balanced victories like Prague and Leuthen; frequently on the brink of destruction, he was saved again and again by his own energy and by the failure of his enemies to act with vigour and decision: hence there is little need for the exaggeration which mars so many of the Essays, no need to over-emphasize contrasts when the soberest narrative of Frederic's reign must narrate startling changes of fortune and situation. A career so full of dramatic incident was as it were made for Macaulay, and the way in which he rushes straight at his theme without any of the preliminary skirmishing with the work he is nominally reviewing illustrates this well.

'It would not be an exaggeration to say that to most English readers of history the picture of Frederic which is most familiar is the picture drawn in these pages by Macaulay. Written many years before Carlyle published his life of Frederic, Macaulay's Essay has all the advantages of brevity, lucidity, and simplicity when contrasted with the lengthy biography by Carlyle: it gives the reader a definite and clear-cut impression of the Prussian king as a man and, to a rather less degree, as a ruler. Macaulay has perhaps done Frederic a little less than justice as a ruler, but then he only deals in this Essay with the first half of his reign and it was in the years after 1763 that Frederic was able to devote himself most vigorously to the civilian side of his task. . . .

'. . . The story Macaulay had to tell required no manipulation to make it dramatic. One may perhaps tone down the abruptness and over-definiteness of some of his too positive statements, but in the main there is nothing serious to criticize. The only thing that does really call for serious protest is the picturesque but altogether unfair account given of Frederic's father, who is absolutely caricatured by Macaulay, though it may be admitted that when the Essay was written the real merits of Frederic William, obscured as they to some extent are by brutalities and eccentricities, were not as widely recognized by historians as they are now by a better-informed generation.

'. . . Macaulay has given a disproportionate prominence to the story of Frederic's connexion with Voltaire. The temptation to exaggerate this episode must have been great. Macaulay was always in his element in exposing the foibles and weaknesses of men who have played great parts in history, and the contrast between this side of Frederic's life and his success as a ruler and soldier is almost ludicrous. One feels after reading the story of the episode as though one had just listened to a merciless cross-examination of a witness who had something he wanted to keep back. The episode serves incidentally to provide Macaulay with some splendid opportunities for sarcasm and satire, and one cannot but feel that it is this which has led him to dwell so much on it. Indeed, he is really quite unfair to Frederic, who was treated by Voltaire in a most unreasonable way, irritating and provocative in the extreme. . . .' (C.T.Atkinson, ed. Macaulay, *Frederic the Great*. Oxford,1918.)

Macaulay's essay on Frederic the Great appeared in the *Edinburgh Review* of April 1842.

HISTORY OF ENGLAND

Macaulay's original plan was to 'write the history of England from the accession of King James the Second [1685] to a time which is within the memory of men still living' [through the reign of George IV]. The scope of the fragment which is left to us is so gigantic that its application to

lengthy periods would have been a physical impossibility. The fragment covers a space of some fifteen years. Morison has declared that if the original plan had been carried out on its present scale, in order to bring the narrative down to the end of the reign of George IV, Macaulay would have needed not only fifty volumes but, at the rate of a volume every three years, one hundred and fifty years in which to write them! The immense compass of the projected work was due to Macaulay's desire to write history in a new and more dramatic way than that employed by his predecessors. He hoped to 'relate the history of the people as well as the history of the government, to trace the progress of useful and ornamental arts, to describe the rise of religious sects and the changes of literary taste, to portray the manners of successive generations, and not to pass by with neglect even the revolutions which have taken place in dress, furniture, repasts, and public amusements.' As a Whig, he wished to trace the course of the revolution which in 1688 gave birth to Cabinet government, to describe the conditions which produced what he thought was a 'prosperity of which the annals of human affairs had furnished no example,' and to paint the rise of 'an empire not less splendid and more durable than that of Alexander.' It was an aim which would inevitably please the mid-Victorian public, prosperous, optimistic, complacent.

Macaulay's history is graphic, confident, liberal in tone, and masterly in its narrative methods. 'Historical narrative in his hands is something vastly more complex and involved than it ever was before. Indeed, "narrative" is a weak and improper word to express the highly organized structure of his composition. . . . His pages are not only pictorial, they are dramatic. Scene is made to follow scene with the skill of an accomplished playwright. . . . The interest of the story is kept up with a profound and unsuspected art. The thread of the narrative is never dropped. When transitions occur . . . they are managed with such skill and ease that the reader is unaware of them. . . . In short, Macaulay was a master of the great art of *mise en scène* such as we never had before. . . . The accusation of party-spirit seems on the whole to be unfounded . . . Macaulay, when he wrote his *History*, had ceased to be a party man as regards contemporary politics, and in his work he is neither a Whig nor a Tory but a Williamite. He over and over condemns the Whigs in unqualified terms, and he always does justice to the really upright and high-minded Tories . . . "There never was a writer less capable of intentional unfairness," says Mr. Gladstone. . . . His inaccuracy arose from hearty dislike for men of whom he honestly thought ill. Of conscious duplicity and untruth, no one who knows him can conceive him guilty.' (J.Cotter Morison, *Macaulay* [English Men of Letters Series], New York,1883, pp.142–43,152, etc.)

Although Macaulay spared himself no labor in mastering contemporary pamphlets and journals, and in consulting books, maps, and historical sites, his ignorance of contemporary correspondence vitiates the value of parts of his *History*. Even portions of the famous third chapter suffer from his lack of familiarity with the letters of the period. Nevertheless in that remarkable chapter, he 'drew England in its entirety — London, the streets of Bristol, the little country town, the wild moors and marshes of the north. Errors of detail, and sometimes errors of greater moment, he commits, but he makes his readers see England as it was. . . . His genius was that he saw poetry and the hidden life of the nation behind the façade of high statesmanship and the records of the great.' (Arthur Bryant, *Macaulay* [Great Lives Series], p.104.)

JOHN STUART MILL (1806–73)

CHRONOLOGY

I. *Childhood and Early Utilitarianism* (1806–30)

1806–17 Born in Pentonville, London, on May 20, 1806, eldest son of James Mill, historian and Utilitarian philosopher; educated by his father, a strict disciplinarian; read widely, by his eighth year, in the Greek and Latin classics, in Greek, Roman, and English history; early began the study of algebra, Euclid, and the instruction of the younger children of the family; spent most of his time in his father's study; was taught to accept no opinion on authority, but to think for himself; had a not unhappy childhood, but one which was a strain on his constitution, and which was tragically poor in childhood experiences — Mill was never a boy.

1818–19 Began the study of Aristotle, and scholastic logic; was introduced to political economy, and studied Adam Smith and Ricardo with his father, who published (1818) the *History of India*.

1820–21 In France, for six months a guest in the family of Sir Samuel Bentham, brother of Jeremy Bentham; read and wrote, studied chemistry, botany, mathematics, French.

1821–25 Returned to England in July 1821; began the study of psychology, and of Roman law, which he read with John Austin; considered the bar as a career; abandoned law, and became a clerk in the India House, where his father was an official (gradually rose until he became examiner in 1856); read Dumont's exposition of Bentham's theories, which gave unity to his ideas and was one of the turning points in his life; studied the history of the French Revolution, with a design to write on the subject; established, with a few friends, the 'Utilitarian Society,' for discussions and debates (1822–23); became one of the chief contributors to the new 'philosophical radical' journal, the *Westminster Review* (founded in 1824); was actively engaged in the discussions at a reading society formed at Grote's house in 1825; founded the 'Speculative Society' in the same year, with several noted members of Parliament and nearly all of the best speakers of the Oxford Debating Society and of the Cambridge Union (Villiers, Charles Austin, Romilly, Praed, and Macaulay), together with Samuel Wilberforce, Thirlwall, Poulett Thompson, Fonblanque, and others — representing various contending political opinions.

1826–30 Experienced a period of 'crisis': began to have misgivings about the ends he had set before himself, and about the narrow intellectualistic form of Utilitarianism inherited from his father; came under the influence of John Sterling and F.D.Maurice at the 'Speculative Society,' and of Coleridge, Carlyle, and Continental thought (Goethe, the St.Simonians, Comte); began to alter the premises of his political philosophy, to look on political institutions as a moral and educational question rather than one of purely material interests; modified his idea of representative democracy as an absolute principle; broadened his view of human happiness, took a delight in poetry for its own sake; found in Wordsworth's poetry the way out of the depression caused by his narrow, mechanical view of human nature.

II. *The Search for Logic* (1830–44)

1830–31 Visited Paris after the Revolution of July 1830; gathered materials on the Revolution of 1789 (later given to Carlyle); wrote a series of articles (1831) on *The Spirit of the Age* in *The Examiner*, showing his new opinions (and

was greeted, erroneously, by Carlyle as 'a new mystic'); continued his reexamination of logic (begun in 1827–29 at Grote's house), especially of logical axioms and the theory of syllogisms, in 1831; met Mrs. Taylor in the same year (married her in 1851).

832–37 Wrote many articles for *Tait's Magazine*, the *Jurist*, and the *Monthly Repository*; became editor of the *London Review* (1835), which, amalgamated with the *Westminster Review* (1836), became the *London and Westminster Review* (continued editor until 1840); published in the latter the review of Carlyle's *French Revolution*, which helped materially in establishing Carlyle in his London career (1837); read Whewell's *History of the Inductive Sciences* (1837), and decided to formulate the methods of scientific investigation and join this new logic, as a supplement, to the old.

1838–40 Published articles on Bentham and on Coleridge in the *London and Westminster Review*, a manifesto of the new and more humanistic spirit which he sought to breathe into English Radicalism.

1841–46 Carried on a correspondence with Auguste Comte.

1843 Published the *System of Logic*, which became the text-book of the Empirical school and the guide of all 'Radical' thinkers of the day; presented a brilliant analysis of induction and the procedure of science; but ended, in the sixth Book, with the discovery that a 'science of Character' (Ethology) is needed to bridge the gap between the laws of mind and the laws which govern society.

1844 Published *Essays on Some Unsettled Questions of Political Economy* (written in 1831, when Mill was becoming conscious of the 'anomalies and evils characteristic of the transition' between old and new opinions); began to turn his attention to the principles of political economy as the groundwork for a humane sociology.

III. *Political and Social Theory* (1844–65)

1846–47 Advocated the creation of peasant-proprietorships as a remedy for the distress revealed by the Irish famine.

1848 Published *Political Economy*, which became at once the handbook of Victorian progressives who, on the prosperity following the abolition of the Corn Laws, thought that the 'state of polemical discussion' had now passed and that a great constructive era had dawned.

1849 Vindicated the French Revolution of 1848, in the *Westminster Review*, in reply to Lord Brougham.

1851 Married Mrs. Taylor (Harriet Hardy), who, during her long friendship with Mill, had lived apart from her husband, and who had supplied the missing element of emotion and poetry to Mill's existence. (Though Mill declared that he owed none of his technical doctrine to Mrs. Taylor, she influenced his attitude toward the individual and society, and directly inspired the essays *On Liberty* and *The Subjection of Women*.)

1854 Suffered a serious illness, and spent eight months in touring Sicily, Italy, and Greece.

1857–58 Drafted a petition to Parliament on behalf of the East India Company now threatened with extinction; retired on the dissolution of the Company, with a pension of £1,500 a year; mourned the death of his wife (1858).

1859 Published *On Liberty*; and *Thoughts on Parliamentary Reform* (expressing hostility to the ballot, and a claim of representation for minorities, and for plurality of votes to be given, not to property, but to proved superiority of education).

1861 Published *Representative Government*, which systematized his opinions as found in many of his essays.

1862 Wrote in *Fraser's Magazine* on the American Civil War, taking the Northern side.

1863 Published *Utilitarianism*, a systematic attempt to answer objections to his ethical theory, and to show that it included the pleasures of the imagination and the higher emotions.

1864 Published an article on *Comte and Positivism*, in the *Westminster Review*.

IV. *Parliamentary Career and Last Years* (1865–73)

1865–68 Became M.P. for Westminster (1865), in spite of his refusal to canvass or to promise to attend merely to the business of his constituency; was active in the debates on Disraeli's Reform Bill (1867); spoke with marked effect on representation of women, reform of land tenure in Ireland, reduction of the national debt, and reform of London government; subscribed to the election of Bradlaugh (free-thought advocate, accused of atheism); headed the committee to bring Governor Eyre to judgment (1866) (opposed by the Defence Committee, composed of Carlyle, Ruskin, Tennyson, Kingsley, Dickens); was made rector of St.Andrews (1866); was defeated in the general election of 1868, and retired to Avignon, where his wife had been buried.

1869 Published *The Subjection of Women*; meditated writing a book on socialism.

1869–73 Started the Land Tenure Reform Association; wrote the essay on *Theism*, and his *Autobiography* (published in 1873).

1873 Died in Avignon on May 8.

Posthumously published works: *Autobiography* (1873); *Three Essays on Religion* (1874); *Chapters on Socialism*, in *Fortnightly Review* (1879).

COMMENTARY

'Mill's is a mind vigorous, free, frank: keen, but never cold. Here — agree or disagree with what he says — is that rare thing, perfect fairness; a candour that refuses nothing and keeps nothing back, in most unusual conjunction with an enthusiasm burning with sure unwavering flame. To read Mill is to be in contact with an intelligence of the first order, which cuts through the sloppy, the flabby and the merely sentimental and annihilates the taker of words for things, but cuts, always, in order to make, not break. He never dodges; he always states the whole case, points against as fully as points for; he never leaves his own opinion in doubt, or omits any of the stages in the process by which that opinion has been reached. His is a wholly realistic intelligence, and a completely unconventional one. Not a trace in it of Victorian complacency.

'It belongs, of course, to its period. He believed in historic development, at a time when few did; but he could not foresee its course. His concern, in the main, is with ideas and forces that are independent of period, and when the modern reader least agrees with him, he will find himself confronted with a case that has to be met. Nor are his ideas as old-fashioned as many suppose. Let those who ask what he has to do in a series dedicated to the foundation layers of Socialism recall that he was the first British writer of accepted standing to treat Socialism with serious respect, and assign to it a commanding importance. Let them remember, further, that he shook the very foundations of the "classical" economics of his day when he, first, proved that Distribution did not rest on immutable laws, quasi-physical in character, as was then taken for granted, but was an affair of human will, alterable so soon as men willed to alter it; and, second, when he publicly threw overboard his own earlier acceptance of Ricardo's theory of the Wages Fund. His political contribution was hardly less significant. Because he believed, with passion, in freedom of action and of thought for everyone, he saw, and

showed to a previously blind generation, that the vast majority of men, and all women, were in his day, suffering from a denial of that freedom. For women and for working men he fought, tirelessly; against privilege, in all its forms, as against the vulgar gospel of getting on, he fought, as tirelessly.

'He was, of course, a democrat. He did not like "strong" men, and would have seen little but slackness of will and sluggishness of mind in our hankering after dictatorships. Some of his bright expectations from political democracy have been falsified; are not the things he wanted and we want to be achieved rather by its fulfilment, in the economic sphere, than by its rejection and the substitution of force for reason and consent? In any event, his work cannot but help any free mind to a genuine judgment. We have to meet in the path of progress somewhat different lions; but lions remain, and the need to fight them. In that fight, it is still true that "One person with a belief is a social force equal to ninety-nine who have only interests." Our age is so far like his that it, too, is one of "loud disputes but with generally weak convictions." He had strong convictions. They are good to meet, even if we do not share them.'

— Mary Agnes Hamilton, *John Stuart Mill* (Makers of the New World Series), London, 1933, pp. 12–13.

'Mill's character was eminently receptive of all the influences to which it was subjected. In his youth the prevailing influence is Bentham and James Mill; then comes the time when Sterling and Carlyle gain a large share of his sympathies; to that succeeds the influence of Mrs. Taylor; and after his wife's death, his views (as in the Essay on Theism, which was composed after his bereavement) seem to swing back on some of the older lines from which her ascendency over his mind had diverted them. It is his mental receptivity which constitutes, perhaps, his chief charm; it is that which explains his aims of reconciliation and mediatorship. But it is this also which gives that vacillation which . . . leaves us with the final verdict that he belongs to a transitional period of thought. No one but a "transitional" thinker could, for instance, have written the following sentence in his Essay on Theism — "It is perfectly conceivable that religion may be morally useful without being intellectually sustainable." Such a phrase reminds us of the allegorical devices within which the less audacious spirits took refuge in their criticism of early mythology. It is like the Legal Fictions, which serve as a compromise for those who desire to retain the letter while they change the spirit of old institutions. But it is not written in the temper either of the clear-eyed iconoclast, or the constructive reformer. . . .

'Enough, however, has already been said of Mill in this aspect. We have seen that he has a destructive side, and also a constructive side. As a destroyer, he works with Bentham and James Mill, and certainly, as Dr. Bain remarks, no more formidable trio can be imagined in the work of pulling down rotten institutions. As a constructor, he stands more isolated, for everywhere the ground has to be prepared for the newer edifices. We have certainly no desire to depreciate the value of his constructive agency. In providing science with a careful and elaborate theory of Induction, in sketching the outlines of a new science of Sociology, in discussing the dangers and the inevitableness of Democracy — in these and many other points his influence over the present generation can hardly be exaggerated. If we see, or think we see, further, it is because we stand on his shoulders. Nor is it possible to give an exhaustive enumeration of the various spheres in which his influence has been felt. No calculus, it has been well said, can integrate the innumerable little pulses of knowledge and of thought that he has made to vibrate in the minds of his gen-

eration. In logic, in ethics, in politics, we have nourished ourselves at his springs. Let us make the full acknowledgment of our debt, and also add that while all that is worst in him belongs to the eighteenth century, all that is best is akin to the highest, best spirit of the nineteenth.

'In Mill's case, a longer study may perhaps lessen our admiration of him as a thinker, but increases our affection for him, as a man. Everything about him, it is true, is set in a quiet key. But perhaps the delicate spirit of self-effacement only adds to the power of the teacher. With his temper of sobriety and reserve, he did not think for men; he rather made them think for themselves. Such, at least, is the opinion of Mr. Morley, who, on this point, is a competent judge. Let us note, in passing, that he discovered Tennyson for his generation, that he saved Lord Durham by his quick insight into the value of his report, and that he rescued Carlyle's *French Revolution* from a too probable failure. If, in these matters, he guided the opinions of his countrymen, in other respects he held before them a splendid example of disinterestedness, of courage, and of zeal for mankind.'

— W.L.Courtney, *The Life of John Stuart Mill* (Great Writers Series). London,1889, pp.173–75.

NOTES

ON LIBERTY

'The *Liberty*, Mill tells us, was more directly and literally the joint production of himself and his wife than anything else which bears his name. "I had first planned and written it as a short essay in 1854. It was in mounting the steps of the Capitol [in Rome] in January 1855 that the thought first arose of converting it into a volume. None of my writings have been either so carefully composed or so sedulously corrected as this. After it had been written, as usual, twice over, we kept it by us, bringing it out from time to time and going through it *de novo*, reading, weighing, and criticising every sentence. Its final revision was to have been a work of the winter of 1858–9, the first after my retirement [from the India House in 1858], which we had arranged to pass in the South of Europe." . . . [*On Liberty*] seems to have had very different effects on his different friends. Kingsley, who saw it first on the table in Parker's shop, sat down and read it through then and there, and said that it made him a clearer-headed, braver-minded man on the spot. Caroline Fox held another opinion. "I am reading," she says, in a letter to E.T.Carne, "that terrible book of John Mill's on liberty, so

clear and calm and cold; he lays it on one as a tremendous duty to get oneself well contradicted, and admit always a devil's advocate into the presence of your dearest, most sacred truths. . . . He looks you through like a basilisk, relentless as Fate. . . . [He] makes me shiver, his blade is so keen and unhesitating."

'In one sense the book has a permanent value, and has largely entered into the life and thought of the present generation; in another sense its value is relative merely, because it belongs in spirit to the first rather than the last half of the nineteenth century. It is a reasoned defence of Individualism as an element of absolute and paramount importance in a state and in society. . . . It is a kind of philosophic textbook . . . of "a single truth, which the changes progressively taking place in modern society tend to bring out into even stronger relief: the importance, to man and society, of a large variety of types of character, and of giving full freedom to human nature to expand itself in innumerable conflicting directions." It therefore discusses and defends the individual right to Freedom of Discussion and Freedom of Action, and confines within narrow limits the right of Society to control or to punish. As a vindication of such views, the *Liberty*, doubtless, has great and lasting value. But so far as it confuses character with eccentricity, so far as it belongs to the combative, negative spirit of revolt, rather than to the positive, constructive spirit of organised reform; so far it shares the fate of the old *laisser-faire* doctrine of political economy, and is out of harmony with the tendencies and the ideas of the modern age. . . . We have advanced fast and far . . . , and organisation and synthesis are our mottoes rather than atomism and individuality.' (W.L.Courtney, *Life of John Stuart Mill*, pp.124–26.)

AUTOBIOGRAPHY

Mill's *Autobiography*, part of which had been written in 1861, and part after 1870, came out after his death, in 1873, and revealed to all men how serious and simple had been the life of the 'saint of rationalism.' 'If Mr. Mill's Autobiography has no literary grandeur, nor artistic variety,' wrote John Morley, 'it has the rarer merit of presenting for our contemplation a character that was infested by none of the smaller passions, and warped by none of the more unintelligent attitudes of the human mind. We have to remember that it is exactly these, the smaller passions on the one hand, and slovenliness of intelligence on the other, which are even worse agencies in spoiling the worth of life and the advance of society than the more imposing vices either of thought or sentiment. . . . [Mill's] life was an incessant education, a persistent strengthening of the mental habit of "never accepting half-solutions of difficulties as complete; never abandoning a puzzle, but again and again returning to it until it was cleared up; never allowing obscure corners of a subject to remain unexplored, because they did not appear important; never thinking that I perfectly understood any part of a subject until I understood the whole." . . . The Autobiography shows us the picture of a man uniting profound self-respect with a singular neutrality where his own claims are concerned, a singular self-mastery and justice of mind, in matters where with most men the sense of their own personality is wont to be so exacting and so easily irritated. The history of intellectual eminence is too often a history of immoderate egoism. It has perhaps hardly ever been given to any one who exerted such influence as Mr. Mill did over his contemporaries, to view his own share in it with such discrimination and equity as marks every page of his book, and as used to mark every word of his conversation. . . . We may value the more highly, as well for its rarity as for its intrinsic worth, Mr. Mill's quality of self-effacement, and his steadfast care to look anywhere rather than in his own personal

merits, for the source of any of those excellences which he was never led by false modesty to dissemble.' (John Morley, 'Mr. Mill's Autobiography,' *Critical Miscellanies*, III,58–59,65–66.)

THREE ESSAYS ON RELIGION

Published posthumously, in 1874, Mill's *Three Essays on Religion* created commotion among his readers, and renewed many of the controversies which had existed during his lifetime as to his real convictions. His disciples, Sir Leslie Stephen, John Morley, Herbert Spencer, and T.H.Huxley, were struck with consternation at some of Mill's antirationalistic conclusions about religion. On the other hand, many readers saw in the book merely the proof of what Mill had once said of himself: 'I am one of the very few examples in this country of one who has not thrown off religious belief, but never had it.' Besides the essay on 'Nature' the book contained one on 'Utility of Religion' and one on 'Theism.' 'The two first of these three essays,' says Helen Taylor in her introductory notice, 'were written between the years 1850 and 1858.' These dates are significant, for they account, to some extent, for Mill's treatment of Nature. Though his essay on Nature is, in some passages, the expression in prose of that concept set forth in Tennyson's *In Memoriam*, of Nature 'red in tooth and claw,' nevertheless its method and approach are determined by the fact, as Courtney points out, 'that at the time at which it was composed, Darwin's newer view of nature was not fully before the world. Here, as elsewhere in Mill, we are to regard Nature on the ground of a conception based on individual experiences. Mill takes, as Mr. Morley terms it, merely the surface or horizontal view of Nature. The works of Darwin and Herbert Spencer enable us to substitute for this what may be called a transverse section of natural phenomena, whereby we can observe the successive layers of a historical development. One result of the latter view is effectually to reduce that power which Mill attributed to man, of altering or transforming the course of nature for his own and other's good: for man is shown to be swept along the current of natural forces, and to be himself a part of nature.' The essay remains, however, of considerable historical value in any study of the Victorian mind, especially of that mind before the implications of evolutionism were completely before it, and while the reaction to the Wordsworthian spiritualization of Nature was at its height.

For a criticism of Mill's consideration of 'Nature as a norm of conduct,' see J.W. Beach, *The Concept of Nature in Nineteenth-Century English Poetry* (New York,1936), pp.187–90.

WILLIAM MORRIS
(1834–96)

CHRONOLOGY

1834–43 Born in Walthamstow, March 24, 1834; father, William Morris, a young, successful broker in Lombard Street; mother, Emma Shelton Morris, daughter of a music teacher; in 1840 the Morrises moved to a large country estate, Woodford Hall, Epping Forest, where young William rode about, dressed in toy armor, seated upon a Shetland pony; continued his love of books — which his early delicate health had fostered, prompting him to read at the age of four; the Waverley novels delighted him, as did Lane's *Arabian Nights*.

1843–53 Went to school at Walthamstow (1843) until his father's death in 1847; entered the new public school, Marlborough College (1848), and acquired a good knowledge of English Gothic architecture; contemplated taking holy orders; moved with his mother to Water House, Walthamstow (1848); read with a private tutor (1851) in prepara-

tion for Oxford, learning Latin and Greek with ease; passed the entrance examination (1852).

1853–57 Entered Exeter College, Oxford (Jan., 1853); felt strongly the influence of the Newman of the Tractarian era; acquired the nickname of 'Topsy' or 'Top,' after the character in *Uncle Tom's Cabin*, because of his wild, curly hair; began a great and lasting friendship with Burne-Jones; received an income of £900 a year upon reaching his majority; made his first acquaintance with Malory and Chaucer (1855); visited Cambridge; financed and acted as editor of a new monthly magazine, *The Oxford and Cambridge Magazine* (1856); took his B.A. degree (1856); met Dante Gabriel Rossetti, decided to try painting himself, and elected to give up architecture as a profession (Dec., 1856).

1857–60 Moved with Burne-Jones to 17 Red Lion Square, Rossetti's old quarters (1857), and designed the furniture for the place; painted his first pictures: *Sir Tristram and the Dog* (oil), and *Soldan's Daughter in the Palace of Art* (water-color); published *Defence of Guenevere and Other Poems* (1858) with no success; married Jane Burden (April, 1859), and toured Paris, Belgium, and the Rhine; began the building of his famous Red House at Upton, in Kent, to the designs of Philip Webb; lived there, 1860–65.

1860–71 Started the firm of Morris, Marshall, and Faulkner, Decorators (1861), wall paper becoming a prominent product of its shop (8 Red Lion Square); while at Littlehampton with his family, Morris fell very ill of rheumatic fever (1864), a malady which proved to be chronic; sold the Red House (1865), moved the firm's business address to 26 Queen Square, Bloomsbury, and located his family there; published the *Volsunga Saga* with Magnússon.

1871–75 Moved to Kelmscott Manor House, taking Rossetti along as co-tenant; made his first tour in Iceland with Magnússon, Faulkner, and W.H.Forde (1871); illuminated a 6 x 4½-inch copy of FitzGerald's *Rubáiyat* (1872); added dyeing to his firm's activities; published *Love Is Enough, or the Freeing of Pharamond* (1872).

1875–77 Morris, Marshall, Faulkner and Co. dissolved and reorganized under the sole proprietorship of Morris (1875); re-issued *The Defense of Guenevere*, published *Three Northern Love Stories*, translations from the Icelandic, and translated the *Aeneids* of Virgil (1875); was appointed Examiner at the Schools of Art, South Kensington (1876), a post which he held until his death; published *Sigurd the Volsung and The Fall of the Nibelungs*, *The Two Sides of the River*, and *Hopeless Love* in 1876.

1877–78 Declined the Professorship of Poetry offered him by Oxford (1877); founded the Society for the Protection of Ancient Buildings (1877); began his active socialism with his work on the Eastern Question Association — and the *Manifesto to the Working Men of England* (1877); executed stained-glass windows for Marlborough College; delivered his first public lecture in London: 'On the Decorative Arts' (1877).

1878–83 Vacation trip to Italy; returned to live at Hammersmith in an old house renamed Kelmscott House in memory of his Oxfordshire home; became treasurer of the National Liberal League (1879), and met H.M.Hyndman (later founder of the Democratic Federation); lectured on art at Wedgewood (1881) and at Birmingham (1882); moved Morris and Company to rural Merton Abbey (1881).

1883–90 Became Honorary Fellow of Exeter College, and a member of the Social Democratic Federation (1883);

lectured extensively (London, Manchester, Glasgow, Yorkshire, Leicester), founded the Socialist League (Dec. 30, 1884), and joined its Art Workers' Guild; was reconciled with F.M.Brown; published the first *Commonweal* (Feb., 1885), the organ of the Socialist League, financing it himself; published *A Dream of John Ball* in the *Commonweal* (Nov., 1886–Jan., 1887), and in book form (1887); lectured in Birmingham for the Socialist League, and again for the Arts and Crafts Society (1888); finished and published *The House of the Wolfings*, the first of his books printed with selected type (1888); lectured for the art schools in Glasgow, Edinburgh, and Macclesfield (1889); traveled to Paris to the International Congress of Socialists (1889); gave up his control over the *Commonweal*, although he remained financially responsible (1889); wrote and published in November (1889), *The Roots of the Mountains*, another venture into the printing business.

1890–94 Published *News from Nowhere* in book form (1891); made a tapestry for Exeter College; set up the Kelmscott Press in the Upper Hall, Hammersmith (1891); began preparing a Kelmscott edition of Caxton's *The Golden Legend* (1892); suffered a serious break in health, and toured France (1891); wrote, in collaboration with Belfort Bax, *Socialism: Its Growth and Outcome* (1893).

1894–96 Finished *The Wood beyond the World*, and his translation of *Beowulf*, and published both at Kelmscott (1894, 1895); published *Letters on Socialism*, and 'Why I am a Communist' in *Liberty* (1894), the latter emphasizing his differences with the anarchists; spent the year 1895 busily, translating from the Icelandic, writing, printing, designing, etc.; gave an address at the inauguration of the Oxford Socialist Union; gave two lectures in London on Gothic architecture; began designs for the Kelmscott *Chaucer*; published *The Well at the World's End* (1896); awaited expectantly the completion of his Kelmscott *Chaucer*; was ordered on a sea voyage for his health; went to Norway, but returned in less than a month, much weaker; dictated the end of *The Sundering Flood* (published 1898); died at Kelmscott House, October 3, 1896.

COMMENTARY

'. . . He confessed mournfully that for working men (and he thought that working men had a natural intelligence at least equal to that of the middle class) his writing was "too simple to be understood." The debased modern journalistic style, like the debased modern typography, had grown so familiar from universal use, that a reversion to older and purer types threw people out, and made them complain of a difficulty which they quite honestly felt.

'"Verse has a privilege to be more old-fashioned than prose," observes one of the most scholarly and accomplished of his critics in discussing "The Roots of the Mountains"; "but Mr. Morris's prose is more old-fashioned than his verse." This is true; it seems, however, to miss or ignore that fact which is essential to a sympathetic understanding of the whole of Morris's work, that in literature as well as in the manual arts he was throughout his life striving to take up and continue the dropped threads of the mediaeval tradition; and that his work in both fields, while it was in one sense completely modern and even in advance of his age, was based on the return to and development of methods which had long since gone out of fashion, if they had not become completely obsolete. To go back to the fourteenth century, not with the view of staying there, but of advancing from it on what he conceived to be the true high road

out of which the arts had long wandered, was his perpetual principle. But it so happens (whether from anything essential to the art or from particular causes to be sought in history) that the fashion of poetry has changed much less since Chaucer's time than the fashion of prose. The English version of the "Gesta Romanorum" (a work which Morris considered to be the perfection of English prose) is, though more recent in date, more old-fashioned than either Piers Plowman or the Canterbury Tales: or in Chaucer himself, the Tale of Melibœus, or the Treatise on the Astrolabe, is more old-fashioned than the Knight's Tale, or than the Book of Troilus and Cressida. It was some feeling of this sort, in combination with his inveterate love of paradox, that made Morris repeatedly startle his friends by casually alluding to Chaucer as "the great corrupter of the English language." For in matters of style and diction, Chaucer, as is proved by the fact that English poetry made no sensible advance for a hundred and fifty years after him, was far in advance of his own day. Whether Morris's attempt to launch English prose style on this fresh pathway was successful is a different question, and one which perhaps few scholars would hesitate to answer in the negative. But his prose was as sincere, and as little a forced copy of mediaeval work, as were his illuminated manuscripts, or his painted windows.' (J.W.Mackail, *The Life of William Morris*, 1907, II,341–42.)

NOTES

NEWS FROM NOWHERE

By 1887 Morris had become convinced that sudden social revolution in the present was not the practicable means for bringing about an ideal society, or even bringing about a firm progress toward it. Having reached this conviction, he could turn his idealizing imagination to the remote past or to the remote future. In the direction of the future, Morris as a writer 'made only one essay.' This was his pastoral romance *News from Nowhere*. It describes the England of some remote future, living under a realized socialism. Edward Bellamy's *Looking Backward* appeared in 1888, and became immensely popular; it presented an American Utopia of the future, glorifying the contributions of machinery and the life of large cities in a machine age, under a State Socialism that had brought about 'a monstrous and almost incredible centralization.' Morris wrote his *News from Nowhere* in protest against Bellamy's book. In the *Commonweal*, June, 1889, he wrote of this book: 'Mr. Bellamy worries himself unnecessarily in seeking, with obvious failure, some incentive to labour to replace the fear of starvation, which is at present our only one; whereas it cannot be too often repeated that the true incentive to useful and happy labour is, and must be, pleasure in the work itself.' J.W.Mackail, Morris's biographer, declared that the sum of Morris's belief in politics, in economics, and in art is contained in that one sentence (*cf.* J.W.Mackail, *The Life of William Morris*, 1907, II,244). By 1889 the Socialist League had become greatly weakened, and in that year a group of anarchists gained executive control. One of their first acts was to oust Morris from the control of the *Commonweal*, the weekly organ of the League. Morris was wonderfully patient. Among his contributions after he was removed from the editorship was *News from Nowhere*, which appeared in successive issues from Jan. 11 to Oct. 4, 1890. By March, 1891, it had been published in cheap book form, in paper covers, and had a large sale. Alfred Noyes (see his *William Morris*, 1908, pp. 129–35) pointed out, fairly enough, many weaknesses in this book, and asserted that there is no book in English more hopelessly illogical. Yet, he further asserted, 'the beauty of the book is in its atmosphere,' and in the fact that 'it marvellously suggests the right road, even while hopelessly contradicting itself.'

Apart from its literary beauty and social fervor, *News from Nowhere* has an historical interest; many reformers in the '80s were working for the type of social reform — a rural and simplified communal existence — that the book suggests. Compton-Rickett stated that it did not much matter to him whether the communistic setting of the book were attacked or defended: its 'elaboration of details,' said he, 'is interesting, for it shows the cast of Morris's mind'; and it is of small importance how many details are practicable or impracticable, compared with 'the dynamic value of the story as a picture of idealised human nature. This is the great thing about the book — it is the great thing in all Morris's books.' (A. Compton-Rickett, *William Morris*, 1913, pp.192–93.)

'*News from Nowhere* is inevitably his happiest work. Here the idealist of 1890 wakes up to find himself in an England, changed after two hundred years into a land fit for Morrises to live in. The book was a reply to Edward Bellamy's *Looking Backward, 2000–1887*, a highly mechanised American Utopia. The Bellamy system of life, pursued to its logical conclusion, ends in the satire of Mr. Aldous Huxley's *Brave New World*, with its robots and their mechanical psychology. Morris's dream is surely the most vivid and enviable among famous Utopias. Cheerfulness will keep breaking through his sociology, and there is very little bother about law and government. He was much

amused by certain people who took *News from Nowhere* quite seriously as a statement of political belief. The fantasy, however, embodies a good deal of enlightened thought, expressed, for example, in the attitude of the inhabitants of "Nowhere" to marriage and divorce; above all in its emphasis of a truth by which Morris supplements the famous premise at the beginning of Aristotle's *Politics* — "Man is a political animal," and, said Morris, an industrious one' (Montague Weekley, *William Morris*, 1934, p.107).

The extracts here reprinted do not pretend to convey an adequate suggestion of the delightful 'pastoral-romance' atmosphere that is developed by many other passages in the book. These extracts, however, do serve well in showing 'the dynamic value of the story as a picture of idealised human nature.'

JOHN HENRY NEWMAN (1801–90)

CHRONOLOGY

I. *Childhood and Early Oxford Period* (1801–32)

1801–16 Born in London on February 21, 1801, eldest son of John Newman (banker) and Jemima Fourdrinier (of French Huguenot descent); a quiet, serious, imaginative boy, indulging in few games, his favorite pastime being reading, the *Arabian Nights* exerting a fascination over him; sent at the age of seven to a private school at Ealing; had a kind of religious 'conversion' some time in 1816, in which he experienced a vivid faith in the reality of God and his own soul, which lasted throughout life.

1816–22 Matriculated as a commoner of Trinity College, Oxford, on December 14, 1816, and began residence the following June; was known as a shy, puritanical, sweet-tempered student, with 'no grain of conviviality'; became scholar of Trinity (1818); labored hard over his studies, read widely, but because of anxiety over his father's financial reverses and over his own progress and health, failed to gain high honors (1820); gave up thoughts of the bar, deciding to take Holy Orders; graduated in 1821; won the universally coveted election to a fellowship at Oriel College (1822).

1822–33 Came under the liberal influence of Whately, one of the 'Oriel Noetics,' who taught him how to reason and argue; fell under the spell of Butler's *Analogy*; began to 'prefer intellectual excellence to moral,' and to subject all questions to intellectual scrutiny; thus lost his moorings in Evangelical faith in the emotional and intuitive approach to religious certitude, but also gradually drew away from the rationalistic Noetics, toward such men as Pusey and Hurrell Froude; accepted the curacy of St. Clements, Oxford, and took Holy Orders (1824); became public tutor of Oriel (1826); was appointed Vicar of St. Mary's (with the chapelry of Littlemore) in 1828; began to feel vividly the anti-Protestant influence of Hurrell Froude, and read the early Church Fathers, seeking for a new basis for doctrinal and ecclesiastical authority (to result in *The Arians of the Fourth Century*, published in 1833); participated in the opposition to Catholic Emancipation (1829) because its supporters were dominated by religious liberalism and indifferentism; was made select preacher to the University (1831–32); developed a close friendship with Hurrell Froude, John Keble, and Edward Pusey, who shared his antipathy to rationalistic and liberal tendencies in the Church; had a difference with Hawkins, provost of Oriel, over the 'substantially religious nature' of a tutorship, and resigned that post in 1832; went for a Mediterranean tour with Froude, to

recuperate his health and further organize his ideas; was repelled, in Italy, by the 'Roman Catholic system,' composed most of the *Lyra Apostolica* and *Lead, Kindly Light*; after serious illness in Sicily, returned to England on July 9, 1833.

II. *Later Oxford Period: the Oxford Movement* (1833–45)

1833 Found England in the throes of the new era of reform; was alarmed at the Whigs, who, having abolished ten bishoprics in Ireland, were now seeking to disestablish the Church of England, and were regarding it as virtually a department of the State (Erastianism); hailed Keble's sermon on 'National Apostasy' (July 14) as the beginning of a movement to (1) assert the spiritual independence of the Church from the State, (2) combat the rationalism encouraged by the Noetics, (3) seek a firmer foundation than current theology for the Catholic tradition latent in Anglicanism, and (4) retrieve the tradition of true piety, spirituality, and authority, as found in the early Fathers; began the *Tracts for the Times* in September, advocating the *via media* between Protestantism and Roman Catholicism, and aiming to secure for the Church of England a definite basis of doctrine and discipline, in case of either disestablishment, or secession of High Churchmen.

1835 Was joined in the Movement by Pusey, who, by adding his initials to his tract on fasting, gave the Movement the name of 'Puseyitism.'

1835–39 Continued to superintend the *Tracts*, which sold faster than they could be printed; delivered his famous Sunday-afternoon sermons, dealing chiefly with the relations between reason and faith, the reasonableness of belief, etc. (prominent people journeying to Oxford to hear the sermons; his followers crying *Credo in Newmannum*); disturbed by many of his followers going Romeward; participated in the opposition to the appointment of R.D. Hampden as Regius Professor of Divinity, on the grounds of the latter's unorthodoxy; became editor of the *British Critic* (1836); became disturbed by his discovery (1839) of the similarity between the Anglican position and the 5th- and 6th-century heresy known as Monophysitism, and by his reading in the *Dublin Review* Wiseman's article comparing the Anglicans with the Donatist heretics of the 4th century; concluded that since each heresy had, like Newman and the Anglican divines, appealed to antiquity, but had been silenced by a living authority (the Church), the *via media* should therefore be relinquished.

1841 Published *Tract XC*, to 'test the tenability of all Catholic doctrine within the Church of England,' suggesting that the Thirty Nine Articles had not been directed against the Roman Catholic position but only against popular errors and exaggerations; met with a storm of indignation in Oxford and elsewhere; discontinued the *Tracts* at the request of the bishop of Oxford; resigned the editorship of the *British Critic*, and considered himself as 'on his deathbed as regards membership with the Anglican Church.'

1842 Retired to Littlemore, where he and a few faithful followers established a semi-monastic life; supervised the writing of *The Lives of the Saints*; wrote *The Development of Christian Doctrine*, to show that the Church as a living organism develops a growing body of doctrine, and that the later Councils of the Church are as authoritative as the earlier Councils appealed to by the Anglicans.

1843 Published in the *Oxford Conservative Journal* an anonymous but semi-formal retraction of all that he had said against the Roman Catholic Church.

1845 Was received on October 9 into the Roman Catholic Church.

III. *Newman under Eclipse* (1845–64)

1846 Went to Rome, where he was ordained priest and given the degree of D.D. by the pope; experienced difficulty in getting a hearing; saw new converts treated without enthusiasm, and his own work regarded with suspicion, as being subversive of true doctrine; joined the Oratorians, a semi-monastic order, without vows, chiefly pedagogical, with independent houses and private property, founded by Philip Neri in Florence, 1575.

1847 Returned to England, and settled at the Oratory at Egbaston, near Birmingham, as head, where he remained for nearly forty years; established the London Oratory, with Faber as head.

1850 Delivered a series of brilliant sermons or lectures on *The Difficulties of Anglicans*. (Popular feeling running high, as Pope Pius IX planned to restore the hierarchy in England.)

1851–52 Involved in a libel suit by an ex-Dominican friar, Dr. Achilli, to whose anti-Catholic utterances, Newman had replied by accusing him in detail of gross immorality (fifth lecture in *The Present Position of Catholics*); fined £100 and costs (£14,000); was supplied the sum by contributions from Catholics in England and America, with a surplus with which to buy a small property at Rednal, where Newman now lies buried.

1852 Made rector-elect of a projected Catholic University in Dublin; began his lectures on *The Idea of a University*; prevented by the jealousies and the inertia of the bishops from continuing the work of organization; resigned as rector in 1856, his appointment never having been confirmed.

1857 Was asked to edit a new translation of the Bible; unsupported by the bishops; abandoned the project.

1858 Proposed a branch house of the Oratory at Oxford; was opposed by Manning and others; abandoned the scheme.

1859 Established, in connection with the Birmingham Oratory, a school for the education of the sons of gentlemen on lines similar to those of the English public schools, an important and successful work in which Newman was interested for the rest of his life.

1860 Made editor of *The Rambler*, a liberal Catholic magazine; was compelled within two months to resign; languished almost forgotten by the world at large, in almost constant difficulties with his superiors, who feared his courageous efforts to meet the tide of popular agnosticism with enlightened treatments of doctrinal problems.

1863 Saw his opportunity (in December) to vindicate his career, when Charles Kingsley's review of Froude's *History of England* appeared in *Macmillan's Magazine* for January 1864, with the passage: 'Truth for its own sake had never been a virtue with the Roman clergy. Father Newman informs us it need not be, and on the whole ought not to be. . . .'

IV. *Final Victory: Last Years* (1864–90)

1864 Exchanged letters with Kingsley, who made a crude and partial recantation and apology; was stung to fine fury by Kingsley's pamphlet, *What, then, does Dr. Newman Mean?* and therefore published a series of seven pamphlets in reply, on successive Thursdays from April 21 to June 2, all of which, except the first two, became later, with minor changes, the *Apologia pro vita sua*, a religious autobiography, or history of his religious opinions, in simple confidential tone, which restored Newman to a high place in British public opinion.

1865 Published *The Dream of Gerontius and other Poems.*

1866–67 Made another attempt to establish an Oxford branch of the Oratory; again opposed by Manning, and blocked by Propaganda.

1867–70 Opposed the definition of Papal Infallibility by the Vatican Council, and the establishment of the 'inspiration of Scripture'; accepted both decrees when once established, though much disturbed over the untimeliness of the first; published the *Grammar of Assent* (1870).

1874–75 Published the *Letter to the Duke of Norfolk* as a reply to Gladstone's statement that the Roman Church had 'equally repudiated modern thought and ancient history' (*Vatican Decrees and their Bearing on Civil Allegiance*), and that it was impossible for a Roman Catholic to be loyal to Britain and to an 'infallible pope.'

1877 Republished his Anglican works, including the two volumes of defence of the *Via Media*, with prefaces and notes explaining his position.

1878 Was made Honorary Fellow of Trinity College, Oxford; now universally honored and revered.

1879 Was created Cardinal.

1880 Preached in Trinity College, Oxford, on Trinity Sunday, at the Jesuit Church, to a crowded congregation.

1890 Died on August 11; buried at Rednal.

COMMENTARY

'John Henry Newman is indeed himself a remarkable instance of one of his own most characteristic contentions, that the same object may be seen by different onlookers under aspects so various and partial as to make their views, from their inadequacy, appear occasionally even contradictory. A very able German Catholic critic recently said to the present writer, "Newman is the originator of the theory of development in dogma — he is that or he is nothing." This critic took the famous Essay on its theoretical and philosophical side. But while to some Newman is thus before all things a religious philosopher — and he has often been compared with Pascal — there are others, like Lord Morley, who appear to see in him little more than a great master of English prose who is hardly to be reckoned a thinker at all. By yet others he has been placed in the category of the great ecclesiastical writers in history, the eloquence and force in some of his later sermons suggesting a comparison with Bossuet, his personal charm and delicate balance of mind recalling Fénelon. English Catholics think of him primarily as the great defender of their religion against Mr. Kingsley, Dr. Pusey, and Mr. Gladstone; as the man who has annihilated by his brilliant irony both High Church Anglicanism and the bombast of Exeter Hall in the lectures of 1849 and 1851. Yet the champion who entered the lists on behalf of the Roman claims in 1849 is still hailed by many as the founder of modern Anglicanism. There are, on the other hand, thousands for whom Newman's writings belong, to use Dean Stanley's phrase — "not to provincial dogma, but to the literature of all time." He is for them the author of the Oxford Sermons, with their matchless insight into human nature; the religious poet who wrote the "Dream of Gerontius" and "Lead, kindly Light"; while the "Apologia" belongs in their eyes to the literature of self-revelation, not to apologetic. To others, again, he is the theologian who has an almost unequalled knowledge of the first three centuries of Church history. Such was Döllinger's estimate of him. And by some he was for long chiefly thought of as the greatest exponent of the views of the minority at the Vatican Council. . . .

'Newman's life-story must, moreover, be looked at as a whole, and from the beginning, that its interest may be fully realised. We must have before us the child whose imagination ran on unknown in-

fluences and magical talismans, who thought life might be a dream and the material world unreal; the youth who was at sixteen profoundly conscious of an inward conversion and believed himself "elected to eternal glory," and who henceforth rested in the thought of himself and his Creator as the only two luminously self-evident beings. Then after the brilliant apprenticeship at Oxford and the few years in which the "Oxford Plato," the friend of Blanco White and of Whately, showed some tendency towards intellectualism, we see him from 1828 onwards undergoing a profound religious reaction, which grew into the conviction that he had a definite mission in life.

'And what was that mission? It was one of relentless war against the 'Liberalism' in thought that was breaking up ancient institutions in Church and State, and would not cease from its work until it had destroyed religion. In England its aims were comparatively moderate and its tendencies disguised, but we are now witnessing its inevitable results in Continental Europe. Newman foresaw them in 1828. He saw fresh symptoms of an un-Christian movement in the revolution of 1830 in France, and on one occasion refused even to look at the tricolor that was hoisted on the mast of a French ship. It was not his way to spread a panic or to indulge in alarmist talk of the incoming flood of infidelity. But this was in reality, as we know from a letter written in old age, the anticipation which early haunted him. We learn from this letter that for fifty years he had looked forward to the gradual rising of such a flood until "only the tops of the mountains will be seen like islands in the waste of waters." To rescue his own countrymen from this danger, or to show them an ark of safety, appeared to be a mission specially suited to one keenly alive to the plausibility of scepticism, yet profoundly convinced that modern science and research were compatible with Christianity, and that in Christianity alone could be found the meaning of life and the happiness of mankind. The work was to be done not by talking of unbelief before the world at large saw it coming, not by alarming the simple souls who were to be the soldiers of the truth; but by strengthening the English Church as the home of dogmatic religion; by imparting intellectual depth to its traditional theology and spiritual life to its institutions; by strengthening and renewing the almost broken links which bound the Church of England to the Church Catholic of the great ages — the Church of Augustine and Athanasius. And this was the object of the Oxford Movement of 1833. . . .

'The delicate perceptions which charmed so many were a part of the artist's temperament, sensitive to praise and blame, craving for sympathy. That is a temperament not helpful in the struggle with the world which practical enterprises entail. Its combination with unswerving obedience to the highest and hardest commands of conscience made him for his followers a prophet as well as an intensely sympathetic friend. But such a combination made his struggle with the world yet harder. Conscience bade him reject without hesitation that indulgence of mood and impulse which makes life tolerable to the artistic temperament. And he was ever ready to see in the less congenial path the way of duty.

'Then, again, his extraordinary power of psychological analysis, his insight into the workings of the human mind in individuals and in bodies of men, was a source of great influence in his correspondence with those who sought his advice, as it had been in his sermons at Oxford. But it was a source also of difficulty in a life of action, and this in two ways. Firstly, the habit of minute psychological introspection is apt to beget something of Hamlet's temperament. And in Newman's case this was allied with a quality noted by his Oratorian friend and colleague Father Ryder in the valuable notes on the Cardinal which he left for my use, namely, "his passivity —

making no attempt to fashion the course of his life, but waiting on Providence." At critical moments, when friends expect him to strike and to protest, he says instead, "Fiat voluntas tua." The incident of the Irish bishopric, the suspension of the translation of the Scriptures, the resignation of the editorship of the *Rambler*, the abandonment of the Oxford scheme, are all instances of this.

'But, secondly, Newman *saw too much* for a man of action. Difficulties were too vividly present to his mind in all his undertakings. This marked characteristic of his thought held good likewise of his actions. His belief in God, in another life, in the Church, was unwavering. Yet when Huxley said that he could compile a primer of infidelity from Newman's writings, those who knew them best saw at once the grounds for such a misreading. The sceptic's mind was vividly present to Newman's imagination. History witnessed in his eyes to "the all-corroding, all-dissolving scepticism of the intellect in religious enquiries." He saw to the full the plausibility of the case which might be made out against the truths he most deeply believed. Of all points of faith he felt, as he has told us, that the being of God was most encompassed with difficulty. He believed in the divinity of the Catholic Church. Yet he saw so clearly the human element in it that he sometimes alarmed even those who agreed with him by the closeness with which his mind could approach the line which separated the human from the Divine. His deepest convictions were compatible with a keen sense of all that told against them. Mr. Hutton notes a parallel quality in his literary style — its presentation of currents opposed to its steady, onward, main drift. . . .

'Newman's lifelong preoccupation with the prospect of an unprecedented movement towards unbelief in religion led him from an early date to give close attention to the question, — How can the reasonableness of religious belief be brought home to all the men of goodwill? The Oxford University Sermons (on "The Theory of Religious Belief"), which began as early as 1826, have this for their main object. The "Grammar of Assent" pursued it further. His own friendship with Blanco White, with Mark Pattison, with William Froude, the brother of Hurrell, brought closely home to him the fact that there were honest inquirers to whom the mode in which Christianity was presented to them had made its acceptance impossible. In early years he felt the deficiency to lie largely in the fact that the apologetic current in the Anglican Church did not take adequate account of the actual state of inquiring minds or of their special difficulties. And he regarded the result not only as a matter deeply serious in its bearing on the happiness and welfare of men who were dear to him, but as of overwhelming concern for the faith of the rising generation. He gradually came to see in the Catholic Church the one hope for withstanding a movement towards unbelief which threatened to be little less than a devastating flood. . . . The infidel movement was not merely a moral revolt against Christianity. It had a very prominent intellectual side. There were problems raised by modern philosophers and critics which needed to be met frankly and by free discussion in their bearing on theology. Only thus could a really satisfactory understanding between the theologians and the men of science be achieved. And in its absence the weight of the scientific movement would go to the side of unbelief. Newman seems to have regarded it as his special work to urge the necessity of such a development of thought and learning as should meet this need of the hour.'

— Wilfrid Ward, *The Life of John Henry Cardinal Newman, Based on his Private Journals and Correspondence*. 2 vols. Vol.I, London, 1912, pp.2–3,4–5,15–16,22–23,24.

SELECTED BIBLIOGRAPHY

Bibliography

Nicholls, Norah. 'A Bibliography of the Oxford Movement.' *Bookman* (London), LXXXIV (1933),143.

Principal Works

(The collected works of Cardinal Newman, in definitive form, are published by Longmans, Green and Co., in 41 volumes. This edition includes a posthumous volume of *Meditations and Devotions*, edited by the Oratorians at Birmingham, an *Index to the Works of John Henry Cardinal Newman*, by Joseph Rickaby, S.J., a volume of Newman's *Occasional Sermons*, and *Sermon Notes: 1849–78*.)

Historical Sketches. Vol.I, 1824,1853. Vol. II,1833. Vol.III,1834.

'Essay on Miracles.' In the *Encyclopaedia Metropolitana*. 1826.

The Arians of the Fourth Century. London,1833.

Tracts for the Times. Oxford,1833–41. (Of the tracts, Newman wrote nos. 1,2,3,6, 7,8,10,11,15,19,20,21,31,33,34,38,41,45, 47,71,73,74,75,79,82,83,85,88, and 90.)

Lyra Apostolica. Oxford,1836. (Of the poems in this volume, Newman wrote those signed δ. Most of these poems were subsequently republished in the volume entitled *Verses on Various Occasions*, 1868.)

Lectures on the Prophetical Office of the Church, Viewed Relatively to Romanism and Popular Protestantism. London,1837. (Republished as part of the *Via Media*, 1877.)

Parochial Sermons. 6 vols. 1837–42.

Lectures on Justification. 1838.

Plain Sermons. 10 vols. 1840–48.

Essays Critical and Historical. Vol.I, 1840. Vol.II, 1846.

The Tamworth Reading Room. Letters to *The Times* on an address delivered by Sir Robert Peel. . . . 1841. (Rptd. in *Discussions and Arguments*. 1872.)

Sermons on Subjects of the Day. 1843.

Sermons Preached before the University of Oxford between 1826 and 1843. 1843.

An Essay on the Miracles Recorded in the Ecclesiastical History of the Early Ages. 1843.

Select Treatises of St. Athanasius. Transl. with notes and indices. 1842–44.

An Essay on the Development of Christian Doctrine. 1845.

Loss and Gain: the Story of a Convert. 1848.

Discourses to Mixed Congregations. 1849.

Lectures on Certain Difficulties Felt by Anglicans in Submitting to the Catholic Church. 1850.

Lectures on the Present Position of Catholics in England. Addressed to the brothers of the Oratory. 1851.

The Idea of a University. Nine lectures to the Catholics of Dublin. 1852.

Callista: a Sketch of the Third Century. 1856.

Sermons Preached on Various Occasions. 1857.

University Subjects Discussed in Occasional Lectures and Essays. 1858.

Apologia pro vita sua: Being a Reply to a Pamphlet by the Rev.C.Kingsley, Entitled 'What, then, does Dr.Newman Mean?' 1864. (Rev.ed. 1865.) (See the Oxford ed., with the 1864 and 1865 versions and introduction by Wilfrid Ward. London, 1913,1931.)

A Letter to the Rev.E.B.Pusey on his Recent 'Eirenicon.' 1865.

The Dream of Gerontius. 1865.

Verses on Various Occasions. 1868.

An Essay in Aid of a Grammar of Assent. 1870.

Tracts Theological and Ecclesiastical. 1871.

Essays Critical and Historical. 2 vols. 1872.

Discussions and Arguments. 1872.

Historical Sketches. 3 vols. 1872–73.

The Trials of Theodoret. 1873.

A Letter Addressed to his Grace the Duke of Norfolk, on Occasion of Mr. Gladstone's Recent Expostulation. 1875.

Meditations and Devotions. 1893.

NOTES

THE TAMWORTH READING ROOM

In February 1841, there appeared in *The Times* a series of letters (or discourses) addressed to the editor by John Henry Newman, under the pseudonym of 'Catholicus,' on the subject of secular education as an unfit substitute for religion. The occasion for the letters was an address by Sir Robert Peel upon the establishment of a library and reading-room at Tamworth, a market town and municipal borough in Staffordshire. The substance of Peel's address is given in Newman's opening letter. 'Sir Robert gave expression to a theory of morals and religion, which of course, in a popular speech, was not put out in a very dogmatic form, but which, when analyzed and fitted together, reads somewhat as follows: —

'Human nature, he seems to say, if left to itself, becomes sensual and degraded. Uneducated men live in the indulgence of their passions; or, if they are merely taught to read, they dissipate and debase their minds by trifling or vicious publications. Education is the cultivation of the intellect and heart, and Useful Knowledge is the great instrument of education. It is the

parent of virtue, the nurse of religion; it exalts man to his highest perfection, and is the sufficient scope of his most earnest exertions.

'Physical and moral science rouses, transports, exalts, enlarges, tranquillizes, and satisfies the mind. . . . It makes us know our duty, and thereby enables us to do it; by taking the mind off itself, it destroys anxiety; and by providing objects of admiration, it soothes and subdues us.

'And in addition, it is a kind of neutral ground, on which men of every shade of politics and religion may meet together, disabuse each other of their prejudices, form intimacies, and secure co-operation.' In the second letter, Newman more precisely indicates Sir Robert Peel's opinions: 'A distinguished Conservative statesman tells us from the town-hall of Tamworth that "in becoming wiser a man will become better"; meaning by wiser more conversant with the facts and theories of physical science; and that such a man will "rise *at once* in the scale of intellectual and *moral* existence." "That," he adds, "is my belief." He avows, also, that the fortunate individual whom he is describing, by being "accustomed to such contemplations, will feel the *moral dignity of his nature exalted*." He speaks also of physical knowledge as "being the means of useful occupation and rational recreation"; of "the pleasures of knowledge" superseding "the indulgence of sensual appetite," and of its "contributing to the intellectual and *moral improvement* of the community."'

The seven discourses were later published in the volume entitled *Discussions and Arguments*. They are extremely interesting for several reasons. They show Newman on one of the few occasions when he entered the arena of public controversy over contemporary issues not definitely theological. They are written in a style admirably suited for their subject, and reveal one of the many sides of Newman, the literary man and journalist. In their shrewdness and occasional tartness they foreshadow the effects he was to achieve in the *Present Position of Catholics in England*, in the *Apologia*, and sometimes in the *Grammar of Assent*. They show something of the quality of his mind, its real toughness, its agility, its relentless pursuit of fallacies, its fertility in epigram ('Who was ever consoled in real trouble by the small beer of literature or science?').

Though Newman's mind always required the security of dogma in religion, and was in many respects the mind of the mystic, yet in the field where logical thinking and astute argument counted, he was the match for his liberal, skeptical opponents. Much loose thinking about education, morals, and religion was current in the chaos of the early Victorian period; and many facile solutions which flattered the contemporary mind struck Newman, as they struck Carlyle, as being a menace to real improvement. Newman's Tamworth articles are excellent statements of a point of view which can give no quarter to that of minds like Macaulay's, Lord Brougham's, John Stuart Mill's, or Huxley's. The battle between the two types of mind still goes on, and Newman, who saw very clearly many things which have long since become obscured, provides an interesting criticism of the dogmas of secular liberalism.

In the discourses not included in the present collection, Newman discusses secular knowledge 'in contrast with religion,' as 'not the principle of moral improvement,' and as 'not the antecedent of moral improvement' [discourses 1, 2, and 4, respectively]. It is interesting that the appearance of the Tamworth articles coincided with the publication of *Tract XC*, which, though it made a greater stir than the articles, was but one of the many labors which Newman crowded into his life during the Oxford Movement. It is noteworthy, also, that his pseudonym was 'Catholicus,' suggesting the Tractarian basis of his argument, especially as hostile

to the rising tide of secularism and rationalism.

DISCOURSES TO MIXED CONGREGATIONS

The Victorians loved oratory, from platform and pulpit alike, and the Victorian age produced many great preachers, among them not only Newman but also such masters of eloquence as Robertson of Brighton, Liddon, Spurgeon, Magee, and Boyd Carpenter. Of these six men, only Newman and Robertson are still read, and only Newman survives as great alike in the substance and the form of his sermons. The *Discourses to Mixed Congregations*, published in 1849, represents Newman the fresh convert to Roman Catholicism. No longer a prey to conflicting emotions, but firm and radiant in his faith, Newman shows, in this volume of sermons, a maturity, a vigor, and a self-confidence which are not always present in the earlier discourses. His psychological insight — his greatest attribute as a preacher and expositor — appears at its keenest throughout the volume, but most notably in the second discourse, 'Neglect of Divine Calls and Warnings'; his remarkable flights of imagination and rhetoric appear in 'The Mental Sufferings of our Lord in his passion.' The sermons on 'Nature and Grace,' and on 'Faith and Private Judgment' are included in the present collection because they fall directly in line with two of the master ideas of Newman's life: (1) the idea, revived and emphasized by the Tractarians, of the incommensurability of Nature and Grace, or, put differently, the belief in a way of life, and a reality, which transcends and is wholly different from what we commonly regard as 'real'; and (2) the conviction that 'the wild living intellect of man' is too aggressive, capricious, and untrustworthy to be a safe guide for the individual in matters of faith, and that only a divinely instituted authority, such as an infallible Church, can successfully withstand the deluge of infidelity in the modern world. In both sermons, Newman reveals once more the extent to which he turns to the early Church for doctrine, inspiration, and guidance.

For a richer and more balanced impression of Newman as a composer and deliverer of sermons, one should read also in his *Parochial and Plain Sermons*, preached between 1825 and 1843; *Sermons on Subjects of the Day* (1843), with its famous final discourse, 'The Parting of Friends'; the *Oxford University Sermons* (1843), which deal with one of Newman's basic themes, the relation of faith and reason, and at times foreshadow his *Development of Christian Doctrine* (1845); and *Sermons on Various Occasions* (1857), with its well-known and eloquent tenth sermon, 'The Second Spring.'

LECTURES ON THE PRESENT POSITION OF CATHOLICS IN ENGLAND

This work, as Reilly justly says, shows Newman at his best in 'psychological penetration when enlisted in the cause of controversy. . . . The reëstablishment of Catholic sees [in 1850–51] had inflamed England with suspicion and anger against English Catholics. . . . Cries of "Papal aggression" and "No-Popery," preceded a storm which threatened to sweep even saner leaders of English opinion off their feet. The press was filled with pasquinades and protests in which the "harlot of Rome" was a favorite epithet; priests and their congregations were hooted; indignation meetings were held throughout the country; and the Pope and Cardinal Wiseman were burned in effigy.' (Joseph J. Reilly, *Newman as a Man of Letters*, pp. 188–89.) Newman's lectures, unlike his address on *The Difficulties of Anglicans*, delivered a year before at the Oratory Church in King William Street, London, were unusually unreserved and marked by irony, parody, humor, and occasional sarcasm. As Ward later wrote, 'Those who have read them are aware [that] they abounded in pungent satire, the more effective because it came not from a controversialist

who delighted in strong words and startling statements, but from one who was notoriously reserved in language and self-restrained. In constructive argument, more especially, Newman, alive as he was to all the anomalies and scandals visible in Church history, could very rarely bring himself to employ the positive and confident tone, the strong expressions, the one-sided statements, the would-be demonstrative proofs of many popular Catholic controversialists. His fastidiousness and accurate sense of fact forbade it. . . . He had satisfied himself that he was face to face not with serious convictions, but with a monstrous and preposterous phenomenon — the No-popery prejudice, which had for more than two centuries deformed and disgraced the national mind. He revelled in the strength of his case; and though never off his guard and never forgetting the reservations in his attack which truth required, he let himself go in occasional passages with complete unreserve and great effect.' (Wilfrid Ward, *The Life of John Henry Cardinal Newman*, I,1912, pp.264–65.) Newman himself wrote to Dean Church that he thought the lectures the best written of all his works. Certainly they show a range and power in Newman of which most readers know almost nothing. They reveal that Newman's mind was not only capable of the silvery eloquence of the Oxford sermons, the passionate rhetoric of the *Sermons to Mixed Congregations*, the splendid lucidity of exposition in the *Grammar of Assent*, and the pathos and delicacy of the *Apologia*, but also of broad humor, dramatic appeal, scathing satire, and illuminating and amusing parody. The audience which came to hear the tall ascetic soon broke into peals of laughter as Newman developed his parallel between the Russian's conception of John Bullism and many Victorian Protestants' conception of Roman Catholicism.

The lectures were delivered in the summer of 1851, once a week, in the Corn Exchange of Birmingham, and appeared in book form in the same year.

THE IDEA OF A UNIVERSITY

The nine lectures ultimately published in Newman's collected works as *The Idea of a University* were originally delivered to the Catholics of Dublin from May 10 to June 7, 1852. They were published in the same year under the title of *Discourses on the Scope and Nature of a University Education*. The circumstances under which they were composed were such that a man of lesser courage and perseverance would have been crushed: though Pope Pius IX had given his support to the establishment of a new Catholic University in Ireland, there seemed to be no clear understanding among the Irish of what a university should be; the poverty of the Irish people made it difficult to raise the necessary funds; and, lastly, the Irish bishops were not agreed as to the necessity of a Catholic University. Jealousy, indifference, ignorance, and occasional hostility met Newman at every turn. The lectures were a success, however, in spite of his anomalous position as a man who had been invited to head a projected university without ever having been confirmed in the appointment. They achieved a classic position as the elaboration of 'a theory of university education so liberal, so enlightened, and so far-seeing that they serve today and will continue to serve for many a day to come, as guiding lights for all who would thread their way successfully through the multitude of conflicting and too often erroneous theories of what education really is. . . . Though the university project came to naught, Newman's work was not lost. The discourses and lectures he delivered in the course of his rectorship enshrine, in pages whose serenity is untroubled by the storms that raged about him as he wrote, ideas and principles so generous and so enlightened as to make the very reading of them a liberal education in itself.' (J. Lewis May, *Cardinal*

Newman: a Study, p.145.) Walter Pater summed up the fine quality of Newman's addresses by characterizing them as 'the perfect handling of a theory.'

THE RISE AND PROGRESS OF UNIVERSITIES

The lecture on 'What is a university?' appeared in the Dublin *Catholic University Gazette* (which Newman edited for a year), in June 1854. It was the second of a series published in the *Gazette*. In 1856, under the title of *Office and Work of Universities*, the lectures appeared in one volume. In 1873, they were published as *The Rise and Progress of Universities* in the third volume of *Historical Sketches*.

APOLOGIA PRO VITA SUA

The writing of the *Apologia* was a great emotional and physical strain on its author. Newman wrote it with intensity, sometimes for many hours at a stretch. In his journal, he notes: 'At my "Apologia" for twenty-two hours running.' In sending back some proofs, he wrote: 'Excuse my penmanship. My fingers have been walking nearly twenty miles a day.' The emotional strain was the greater inasmuch as Newman was not only defending himself from what he considered an unjust attack, but was also reliving the poignant memories of his early Oxford days, on the whole the happiest and most successful period of his life. A friend noted that he sometimes wrote throughout the night, often 'with his head in his hands,' frequently in tears, as he realized 'the, to him, well nigh impossibly painful task of public confession.' Yet the autobiography is remarkably accurate, and its absence of resentment, self-pity, or egoism is not the least noteworthy of its characteristics.

After an eclipse of twenty years, Newman was at last able to write in his journal, on October 30 1867: 'I never was in such happy circumstances as now. . . . I am my own master, . . . I have my time my own — I am surrounded with comforts and conveniences. . . . My reputation has been cleared by the *Apologia*.'

As Ross has said, 'The *Apologia* was a national event; it marked a crisis in Newman's life. Henceforth Newman was taken to the heart of the British public, and his writings received an attention they had never before obtained. Newman had become a first-page character, there to rub elbows familiarly with prime ministers, and victorious generals, and primates of all England.' (J. Elliot Ross, *John Henry Newman*, p.163.[1]) 'The *Apologia* holds its place as one of the great autobiographies in literature, and as a classic which most educated people may be expected to have read in, if not read through. It retains in a full measure the quality of charm, a quality which defies analysis in letters as in life. It is distinguished by its utter absence of any sort of pose, which is not very common in religious or other biographies. The simple and dignified manner in which a sensitive and reserved nature undertook the very uncongenial task of intimate self-revelation lends it a rare attractiveness. . . . [The book] wrought a literal revolution in the general estimation of its author; Newman's fame had a "second spring" to which there cannot be many parallels. Kingsley frankly and generously acknowledged that he had "crossed swords with one who was too strong for him."' (Bertram Newman, *Cardinal Newman: a Biographical and Literary Study*, pp.157,160.)

The seven pamphlets which Newman published in reply to Kingsley's charges were thought by some of his friends to be too severe on his opponent. When, therefore, Newman published the work, in slightly revised form, in 1865, he omitted the first two pamphlets, 'Mr. Kingsley's Method of Disputation,' and 'The True Mode of Meeting Mr. Kingsley.' The text was also revised, but only in details of punctuation, capitalization, and occasional

[1] By special permission of the publishers, W.W Norton & Co.

phrasing. The two texts, of 1864 and 1865, may be consulted in the edition issued by the Oxford University Press, with an Introduction by Wilfrid Ward. The text of the present selections is that of the first edition, 1864, as reprinted in the Everyman's Library.

Part III, 'History of My Religious Opinions [up to 1833]' is generally regarded as the most interesting to the average reader; Part VII contains his famous statement of the grounds for his belief in a God, in an institutionalized Church, in Papal Infallibility — a statement which is indispensable to the understanding of Newman's mind.

LIBERALISM

This essay was added to the *Apologia* as 'Note A' in the edition of 1865, by way of explaining Newman's statement in one of the early paragraphs of Part III ('History of My Religious Opinions'): 'The truth is, I was beginning to prefer intellectual excellence to moral: I was drifting in the direction of the Liberalism of the day.' In Part VI he stated his position bluntly: 'There are but two alternatives, the way to Rome, and the way to Atheism: Anglicanism is the halfway house on the one side, and Liberalism is the halfway house on the other.' A close study of Newman's definition of Liberalism, in relation to the other forces of the Victorian era, will reveal the tremendous tension which characterized the intellectual and emotional atmosphere of the time.

THE GRAMMAR OF ASSENT

This work, in which Newman brings to a culmination all his thoughts on the relation between reason and faith, was written between 1866 and 1869, and was published in 1870. The central idea of the book may be discerned in some remarks which Newman made in a letter to Henry Wilberforce: 'It is a law of our nature, then, that we are certain on premisses which do not reach demonstration. This seems to me to be undeniable. Then what is the faculty . . . which enables us to be certain, to have the state of mind called certitude, though the syllogism before us is not according to the strict rules . . . ? Paper logic, syllogisms, and states of mind are incommensurables.' John Locke had long ago maintained that we have no right to accept a proposition as true with greater assurance than the proofs will warrant. Newman's former teacher, Whately, held the same theory; and John Stuart Mill was its greatest contemporary prophet. The rapid development of science, and the power of such expositors as Huxley, had given this theory a firm foundation, and everywhere there were skeptics and agnostics and liberals who professed to withhold religious belief because no 'scientific evidence' for the dogmas of faith could be adduced. Newman's approach to the problem was psychological: he pointed out that skeptics and believers alike are constantly accepting as true what they cannot 'prove' but what nevertheless events justify them in believing. Our certitudes are built up by a vast accumulation of probabilities, each 'too fine to avail separately, too subtle and circuitous to be convertible into syllogisms, too numerous and varied for such conversion, even where they are convertible.' And these certitudes, unlike those arrived at by logical reasoning, have a concreteness, a life, and a value which lead us to give them the name of conviction. For them we are prepared to make sacrifices. The mind reasons spontaneously, and in part unconsciously, its spontaneous activity outrunning its reflective power, and man is therefore frequently supplied with certitudes for which he has very little justifying demonstration. 'The judgment of the mind that it is justified in giving its unqualified assent to a proposition when it is only implicitly conscious of the full reasons therefor, Newman calls the "Illative Sense."' (Ross, p.218.) This Sense is the inherent power of right judgment, as distinct from the conscious use

of logical formulas, and depends not only upon assumptions and unconscious reasonings but also upon certain moral dispositions. Newman holds that coming to right conclusions about the great problems of life requires not merely an act of the understanding but also an act of the moral will: knowledge is concrete, living, volitional, an act of the whole man. In holding to such a theory, and in propounding it so vigorously, Newman was wholly at variance with the general tendencies of his time; he wrote his *Grammar of Assent* during the heyday of Victorian cocksureness that the 'scientific method' could eventually solve every problem, by the employment of reason, and without any aid (or interference) from the imagination, the instincts, or the ethical elements in the human mind.

WALTER HORATIO PATER (1839–94)

CHRONOLOGY

I. *Youth, and Early Education* (1839–58)

1839–58 Born at Shadwell, East London, August 4, 1839, second son of Dr. Richard Glode Pater and Maria Hill Pater; parents probably descended from the Dutch who came over to England with William of Orange, and settled at Olney in Buckinghamshire; the father, a surgeon, had broken away from the Catholic Church before marriage; as a little boy, Pater enjoyed playing at 'clergyman,' enlisting his friends to form a procession, and, arrayed in a nightgown, preaching to his mother, his grand-mother, and his 'Aunt Bessie' (the aunt looked for, and saw to her satisfaction, a real clergyman in him); learned to read under the tutelage of his Aunt Bessie until he was old enough to study under the Headmaster of Enfield Grammar School; attended King's School, Canterbury (1853), Mrs. Pater having moved to Harbledown in order to make the boy's attendance possible; did not like school life, having no sympathy with boys' sports: snowballing, snake-collecting, etc.; enjoyed the ceremonies on Saints' Day; lost his mother (1854) shortly after he had returned to school; met Keble sometime before 1855 at Hursley in Hampshire, with whom he walked and talked, and whom he imitated in little particulars, and from whom he received religious stimulation; was confirmed (1856); wrote his first poem still extant, 'St. Elizabeth of Hungary'—although he had written others before (1856); read Hooker's *Ecclesiastical Polity* (1856); suffered a serious illness as the result of a kick received in a scuffle with a boy (1856); continued to write poems; showed an early taste for Dickens (which he grew away from later), and for Tennyson.

II. *Oxford and Literature* (1858–66)

1858–65 Entered Queen's College, Oxford (June 11, 1858) as a Commoner; spent Christmas at Heidelberg (1858), and acquired a questioning attitude towards Christianity; his Oxford friends included Hoole, Ward, Morehouse, and McQueen; traveled again to Germany (1859), returning to Oxford to make new friendships with Berwick, Grenfell, and Northcote; read Wordsworth and Keats in entirety, Carlyle's *French Revolution*, Scott's novels, Mrs. Gaskell's *Life of Charlotte Brontë*, *Vanity Fair*, and Macaulay's *Essays*; contracted an enthusiasm for Plato from Jowett; read Boswell's *Life of Johnson*, and Goethe's *Dichtung und Wahrheit*; took his final examination, but obtained only second class honors (1862); sought to be ordained by the Bishop of London, which plan his friends, McQueen and Kearney, opposed because of Pater's state of unbe-

lief, and were able to defeat; was elected to an essay society, The Old Mortality (1863), whose members included Ingram Bywater, T.H. Green, Henry Nettleship, Alfred Robinson, Edward Caird, and Edward Bryce; traveled immediately to Dresden (1863) upon the death of his beloved Aunt Bessie, and returned to England, bringing his sisters with him; because of his knowledge of German philosophy, was finally able to gain a Probationary Fellowship at Brasenose College (1864) which had been made vacant by the resignation of C.J. Wood; wrote *Diaphanéité* (1864); became an Actual Fellow at Brasenose (1865).

1865–66 Set out with a pupil, C.L.Shadwell on a tour of Italy (1865), visiting Ravenna, Pisa, and Florence, the trip accentuating in him a growing love of the Renaissance, which powerfully affected his later works, and introduced the humanistic leanings which were to replace effectively the earlier inclinations towards the Christian church; read intensely in the English authors, particularly in Coleridge, Lamb, and Sir Thomas Browne; published in the *Westminster Review* a fragment on Coleridge (1866) which distinguished between modern and ancient thought on the basis of relativity and absolutism.

III. *Interest in the Renaissance, and Antiquity* (1866–94)

1866–74 Came under the sway of the 'Art for Art's Sake' Movement (Gautier, Swinburne, etc.), and read Otto Jahn's *The Life of Winckelmann* (1866); wrote and published 'Winckelmann,' an enthusiastic essay in the *Westminster Review* (Jan., 1867); again studied Goethe; published essays on Leonardo da Vinci, Botticelli, Pico della Mirandola, and the poetry of Michelangelo (in the *Fortnightly Review*, Nov., 1869 to Nov., 1871), which, along with a Preface and a Conclusion and the new essays, 'Aucassin and Nicolette,' 'Luca della Robia,' and 'Joachim du Bellay,' and a revamped 'Winckelmann,' were collected in 1873 into *Studies in the History of the Renaissance*, dedicated to C.L.Shadwell; in addition to the foregoing, he produced in 1868 an essay, 'Aesthetic poetry,' which gave judicious attention to the early writings of William Morris.

1874–75 Expected to be given the coveted Proctorship which was at the disposal of Brasenose College in 1874, but was opposed by Benjamin Jowett, who was displeased with the *Renaissance* volume, failed to have the good sense to 'keep his tongue in his head,' behaved unwisely, and lost the honor (the post went to John Wordsworth); his friends of the next few years included Edmund Gosse, C.L.Shadwell, Rev. Mandell Creighton (later the Bishop of London), and Rev. Lewis Campbell; published 'Wordsworth' and 'Measure for Measure' in the *Fortnightly Review*, April and Nov., 1874.

1875–80 Occupied himself with Greek studies, two of which appeared as essays in 1875 and 1876 in the *Fortnightly Review*: 'Demeter and Persephone' and 'A Study of Dionysus' (Dec., 1876); published a review of Symonds's *Renaissance in Italy* (*Academy*, July, 1875), and 'Romanticism' (*Macmillan's Magazine*, Nov., 1876), which later appeared as 'Postscript' in *Appreciations* (1889); spent his time quietly, using the long vacations to go to France and Germany, tutoring during the term times, and living with his sisters in Oxford; his health, not very robust, restricting his activity; wrote essays, among them 'Charles Lamb' (*Fortnightly Review*, Oct., 1878), 'The Bacchanals of Euripides' (written 1878, published in *Macmillan's Magazine*, 1889), 'Love's Labour's

Lost' (written 1878, published in *Macmillan's Magazine*, 1885), and 'The Child in the House' (an autobiographical study, *Macmillan's Magazine*, 1878); friendship, 1877–80, with Richard C. Jackson and others at St. Austin's Chapel (High Church), London, very influential.

1880–90 Decided upon resigning his tutorship, because it was apparent to him that writing was his prime interest, and because, since 1878, he had been interested in working out *Marius the Epicurean*; published, however, two essays before leaving in 1882 to spend the winter at Rome writing *Marius*: 'The Beginnings of Greek Sculpture' (*Fortnightly Review*, Feb., March, 1880) and 'The Marbles of Aegina' (*Fortnightly Review*, April, 1880); left for Rome at the close of 1882, after having spent the summer in Cornwall writing part of *Marius*; wrote essay on Rossetti for Ward's *English Poets* (1883); published *Marius the Epicurean* in two volumes in February, 1885; moved to London, 12 Earl's Terrace, Kensington, near Holland House where he remained for eight years, retaining, however, his address at Brasenose during the terms at school; was warmly received in London, but continued the habit of going abroad with his sisters to France and Italy five or six weeks during the year; began contributing to the *Guardian*, the *Pall-Mall Gazette*, and the *Athenæum* (the contributions were reviews, some twenty of which have been identified, but which were not of great significance); published 'A Prince of Court Painters' (*Macmillan's Magazine*, Oct., 1885); wrote for *Macmillan's Magazine* in 1886 'Sebastian van Storck' (March) and 'Denys l'Auxerrois' (Oct.), and in 1887 'Duke Carl of Rosenmold' (May) and 'A Review of Lemaitre's "Serenus and Other Tales"' (Nov.); produced 'Sir Thomas Browne,' his chief critical work of the period (1886), which was incorporated in *Appreciations* (1889); published five chapters of *Gaston de Latour*, a work which he never completed — a second and weaker *Marius* — (*Macmillan's Magazine*, June to Oct., 1888), and a sixth under the title, 'Giordano Bruno' (*Fortnightly Review*, Aug., 1889); saw new success as his *Renaissance* volume went into its third edition (1888); published an essay, 'Style' (*Fortnightly Review*, Dec., 1888); published 'Hippolytus Veiled' (*Macmillan's Magazine*, Aug., 1889); published *Appreciations* (1889), in which were included two early Shakespearean essays, 'Measure for Measure' (1874) and 'Love's Labour's Lost' (1878), and a third new one, 'Shakespeare's English Kings' (1889), as well as the more important essays already mentioned.

1890–94 Wrote 'Prosper Merimée' as a lecture which he delivered at the Lecture Room at the Taylorian (his large audience attested to his rank as a celebrity) in 1890; began his work on *Plato and Platonism* in 1891, publishing some of the chapters in 1892, and the remainder in 1893; wrote an essay on Dante as an introduction to C.L.Shadwell's translation of *Purgatory* (1892); published 'Emerald Uthwart' in successive issues of the *New Review* (1892), and wrote, as a lecture, an essay, 'Raphael' (*Fortnightly Review*, Oct., 1892); moved from London to St. Giles, Oxford (1893); traveled to Glasgow (1894) to receive an honorary LL.D. and to visit some of the northern cathedrals; suffered an attack of rheumatic fever and was confined to his bed; recovered, but was weak; published one of the Greek studies, 'The Age of Athletic Prize Men,' in the *Contemporary Review*, and the sketch, 'Some Great Churches in France,' in the *Nineteenth Century*,

March, June, 1894; his illness, however, cut short his activity — which he had renewed too soon — for he contracted pleurisy (writing near an open window); again he seemed to grow well, leaving his room July 29; suffered an attack of heart failure, dying suddenly and unexpectedly on July 30, 1894.

COMMENTARY

'. . . His prose steadily grew in volume and depth; and the one serious fault of his writing, the tendency that his sentences have to become long and involved, did not diminish. What he did gain as years went on was a refined and surprising power over words, a power of condensing an elaborate effect into a single haunting sentence which suggests rather than reveals. His work was always the result of much patient and unseen labour; but though he revised carefully and jealously enough in many cases, his richness was not derived in reality so much from these stippled effects, as from the fulness of mind out of which he wrote. Any one who has ever gone over the same ground as Pater, and studied the same authorities, will be amazed to find how conscientiously and diligently the material has all been employed; not by elaborately amplifying detail, but by condensing an abundance of scattered points into a single illuminating hint, a poignant image, an apt illustration. He was entirely remote from those easy superficial writers who generalise from insufficient premises, and bridge the gaps in their knowledge by graceful fabrics of words. All Pater's work was strongly focussed: he drew the wandering and scattered rays, as through a crystal lens, into a burning and convergent point of light. Not to travel far for instances, the essay on Leonardo is a perfect example of this. The writing is so delicate, so apparently fanciful, that it is only through a careful study of the available tradition that one comes to realise how minute is the knowledge that furnishes out these gemmed and luminous sentences. It is true that his knowledge is not pedantically applied, that he concerns himself little with minute and technical questions of art-criticism; but I conceive that Pater's attempt was always to discern the inner beauty, the essence of the thing; to disentangle the personality, the humanity of the artist, rather than to classify or analyse the work. And so it comes about that his art-criticism is essentially a creative thing, that adds little to the historical aspect of the development of art, and falls indeed at times into positive error; the training, the severe observation, the cultivated instinct is there, but it is relegated, so to speak, to an ante-room, while the spirit is led to apprehend something of the mysterious issues of art, initiated into the secret appreciation of beauty, and drawn to worship in the darkened innermost shrine. There is always something holy, even priestly, about Pater's attitude to art. It insists upon the initial critical training, the necessity of ordered knowledge; but it leaves this far behind; it passes beyond the nice apprehension of eye, the cultivated sense of line and colour, the exact discrimination of style and medium, into a remote and poetical region. Such secrets cannot be explained or even analysed; they cannot be communicated to those that are without; they must be emotionally and mystically apprehended, by the soul rather than by the mind.

'It was this secret vision, this inner enlightening, on which Pater had set his heart, and which he sought for urgently and diligently. He loved the symbol, not for itself alone, but for the majesty which it contained, the hidden light which it guarded. It is in this region alone that he seems to wear an absorbed and pontifical air, not with the false sacerdotal desire to enhance personal impressiveness and private dignity, through the ministry of divine powers and holy secrets, but with

the unconscious emotion of one whose eyes behold great wonders enacting themselves upon the bodiless air, which the dull and the contemptuous may not discern.

'It remains to attempt to indicate Pater's position in later English literature, and his philosophy, or rather his point of view, by summarising what has already, it is to be hoped, been made clear by analysis.

'In literature he practically struck out a new line. The tendency of the best prose-writers of the century had been, as a rule, to employ prose in a prosaic manner. Landor had aimed at a Greek austerity of style. Macaulay had brought to perfection a bright hard-balanced method of statement, like the blowing of sharp trumpets. This was indeed the prose that had recommended itself to the taste of the early Victorians; it was full of a certain sound and splendour; it rolled along in a kind of impassioned magnificence; but the object of it was to emphasise superficial points in an oratorical manner, to produce a glittering panorama rich in detail; it made no appeal to the heart or the spirit, awaking at best a kind of patriotic optimism, a serene self-glorification.

'Carlyle had written from the precisely opposite point of view; he was overburdened with passionate metaphysics which he involved in a texture of rugged Euphuism, intensely mannerised. But he had no catholicity of grasp, and his picturesqueness had little subtlety or delicacy, because his intense admiration for certain qualities and types blinded him to finer shades of character. There was no restraint about his style, and thus his enthusiasm turned to rant, his statement of preferences degenerated into a species of frantic bombast.

'With these Pater had nothing in common; the writers with whom he is more nearly connected are Charles Lamb, De Quincey, Newman, and Ruskin. He was akin to Charles Lamb in the delicacy of touch, the subtle flavour of language; and still more in virtue of his tender observation, his love of interior domestic life. He has a certain nearness to De Quincey in the impassioned autobiographical tendency, the fondness for retrospect, which Pater considered the characteristic of the poetical temperament. He is akin to Newman in respect of the restraint, the economy of effect, the perfect suavity of his work; but none of these probably exerted any very direct influence upon him. Ruskin perhaps alone of the later prose-writers had a permanent effect on the style of Pater. He learnt from Ruskin to realise intensely the suggestiveness of art, to pursue the subjective effect upon the mind of the recipient; but though the rich and glowing style of Ruskin enlarged the vocabulary of Pater, yet we can trace the time when he parted company with him, and turned aside in the direction of repression rather than volubility, of severity rather than prodigality.

'It may be said, then, that Pater really struck out a new line in English prose, working on the principles enunciated by Flaubert in a widely different region. The essence of his attempt was to produce prose that had never before been contemplated in English, full of colour and melody, serious, exquisite, ornate. He devoted equal pains both to construction and ornamentation. Whether he is simple and stately, whether he is involved and intricate, he has the contrast always in view. His object was that every sentence should be weighted, charged with music, haunted with echoes; that it should charm and suggest, rather than convince or state. The danger of the perfection to which he attained is the danger of over-influence, seductive sweetness; the value is to suggest the unexplored possibilities of English as a vehicle for a kind of prose that is wholly and essentially poetical. The triumph of his art is to be metrical without metre, rhythmical without monotony. There will, of course, always be those

whom this honeyed, laboured cadence will affect painfully with a sense of something stifling and overperfumed; and, indeed, the merits of a work of art can never be established by explanation or defended by argument; but to such as can apprehend, feel, enjoy, there is the pleasure of perfected art, of language that obeys and enriches the thought, of calculated effect, of realisation, with a supreme felicity of the intention of the writer.

'One does not praise his works as the perfection of style; there is a limpidity and lucidity of prose style — prose as used by Newman, by Matthew Arnold, by Ruskin in chastened moods, — to which no style that depends upon elaborateness and artifice can attain; but it may fairly be claimed for Pater that he realised his own conception of perfection. The style is heavy with ornament, supple with artifice. It is not so much a picture as an illumination. For sunlight there is stiff burnished gold; it is full of gorgeous conceits, jewelled phrases; it has no ease or simplicity; it is all calculated, wrought up, stippled; but it must be considered from that point of view; it must be appraised rather than criticised, accepted rather than judged.

'To feel the charm it is necessary to be, to some extent, in sympathy with the philosophy of Pater. We see in him a naturally sceptical spirit, desiring to plunge beneath established systems and complacent explanations; and this, in common with an intense sensibility to every hint and intimation of beauty, apprehended in a serious and sober spirit; not the spirit that desires to possess itself of the external elements, but to penetrate the essential charm. Yet it is not the patient and untroubled beauty of nature, of simple effects of sun and shade, of great mountains, of wide plains, but of a remote and symbolical beauty, seen by glimpses and in corners, of which he was in search — beauty with which is mixed a certain strangeness and mystery, that suggests an inner and a deeper principle behind, intermingled with a sadness, a melancholy that is itself akin to beauty.' (A.C.Benson, *Walter Pater*, ed. 1926, pp.210 16.)

NOTES

THE RENAISSANCE

'It was from reading Pater's *Studies in the History of the Renaissance*, in its first edition on ribbed paper (I have the feel of it still in my fingers), that I realised that prose also could be a fine art,' wrote Arthur Symons (*Figures of Several Centuries*, 1916, p.322). The Preface was written for the first edition (1873). In later editions the title of the volume became *The Renaissance: Studies in Art and Poetry*. Several of the studies thus published had already appeared as articles — the one on Leonardo da Vinci was a revision of an article in the *Fortnightly Review*, Nov., 1869. The 'Conclusion' was printed in the first edition, omitted in the second (1877), and replaced in the third (1888), with this footnote by Pater, to the title-word: 'This brief "Conclusion" was omitted in the second edition of this book, as I conceived it might possibly mislead some of those young men into whose hands it might fall. On the whole, I have thought it best to reprint it here, with some slight changes which bring it closer to my original meaning. I have dealt more fully in *Marius the Epicurean* with the thoughts suggested by it.'

The essay on Leonardo is by Symons called 'unsurpassable' (Arthur Symons, *A Study of Walter Pater*, 1932, p.23), because of its amazing subtleness in divining and interpreting the essential principles of painting as a fine art.

Thomas Wright declared *The Renaissance* Pater's masterpiece, and said further: 'Few more stimulating works have left the Press; no man can read it without being thrilled — raised above himself — excited to more strenuous effort. Very slowly had this rampired city risen, but its foundation is laid with sapphires and all its borders are pleasant stones. *Marius* and everything else that he did pale before the barbaric beauty of this gorgeous structure.

'Pater's teaching is briefly this: "Imitate the men of the Renaissance and enjoy yourself." Like them, you will find your keenest delight in the "attitude of the scholar," in "the enthusiastic acquisition of knowledge for its own sake."' (Thomas Wright, *The Life of Walter Pater*, 1907, 1,243–44.)

IMAGINARY PORTRAITS

SEBASTIAN VAN STORCK

When asked which was the best of his books, Pater decided in favor of *Imaginary Portraits*, 'for it is the most natural' (Wright, *op.cit.*, II,95). From March,

1885, to the spring of 1887, he wrote, in addition to several articles on English literature, 'the series of delicate sketches which he subsequently issued in book form as *Imaginary Portraits*.' The book appeared in 1887. 'Sebastian van Storck' had previously been printed in *Macmillan's Magazine*, March, 1886. 'As we have several times insisted, Pater's chief title to fame consists in his gift for making Portraits, either entirely or in part imaginary. The portraits in the *Renaissance* owed as much to Pater's brain as to History, those in *Greek Studies* had for foundation nothing more substantial than the figments of old poets; he was now [in *Imaginary Portraits*] to make portraits of Ideas in which the influence of Blake, with whom he was then supersaturated, is easily recognisable. . . . The next sketch, "Sebastian van Storck," seems to have been suggested by Mrs. Humphry Ward's translation of *Amiel's Journal*, which Pater reviewed in *The Guardian* of March 17th. Sebastian van Storck is the story of a man who sterilises his life by "trance-like contemplations of the Infinite," and his career and that of Amiel, who did so little when he could have done so much, have parallels that must strike the most unobservant. The sketch opens with some charming pictures of Dutch life, and then we see Sebastian mewing himself up in a desolate retreat and letting all the pleasures of the world slip by. . . . Like Montaigne, and like Pater himself, he luxuriates in his thoughts, to whatever goal inclined; but he closes his life by an act of self-sacrifice, and thus makes some amends for its misexpenditure.' (Wright, *op.cit.*, II,91–93.)

'These four portraits, taken together, comprise without a doubt the highest achievement of Pater's imaginative prose,' wrote J.Gordon Eaker, and quoted with approval Symons's eulogy of the wonderfully rich, rhythmical, colored, and modulated prose style of the book. (See ***Walter Pater: A Study in Methods and Effects***, Univ. of Iowa Humanistic Studies, V, No.4, Iowa City,1933, p.17.)

APPRECIATIONS

The volume *Appreciations*, published in 1880, was a collection largely of studies in English literature. Its introductory essay was 'Style,' that had appeared first in the *Fortnightly Review* for Dec. 1, 1888, and been reprinted in the *Living Age*, Jan., 1889. 'The Essay on Style . . . is, I think, on the whole, the most valuable thing yet written on that much-written about subject,' said George Saintsbury. 'It presents indeed, as I have hinted, a certain appearance of "hedging," especially in the return to matter as the distinction between "good art" and "great art."' But he concludes that it is 'altogether, in short, a great paper — a "furthest" in certain directions' (*A History of Criticism*, New York,1904, III,548, 549.)

The essay on Coleridge had been written in two sections, the first by 1866, for it appeared in the *Westminster Review* for January of that year. 'The latter part of this paper, like that on Dante Gabriel Rossetti, was contributed to Mr.T.H. Ward's *English Poets*' (Pater's footnote). The latter part did indeed appear as the introduction to the selections from Coleridge in Vol.IV (1880) of *The English Poets*, edited by Thomas Humphry Ward. In the same volume (1883 ed.), as introduction to the selections from Rossetti, appeared Pater's essay on that poet. Written very soon after Rossetti's death, it carries somewhat the tone of a memorial appreciation. 'Yet it is a subtle piece of praise,' said Benson, 'in which at the same time Pater seems delicately to weigh and test the author that he is discussing' (A.C.Benson, *Walter Pater*, 1926, p.86).

The 'Postscript' had appeared first with the title 'Romanticism,' in *Macmillan's Magazine*, Nov., 1876. Here Pater attempts to define the term 'romanticism,' and his discussion is excellently well bal-

anced His phrase, the 'union of strangeness and beauty,' has become familiar in defining romanticism. More fully, 'the romantic character in art' consists of 'the addition of strangeness to beauty' over and beyond order in beauty — 'order in beauty' being a quality of the classical; and Elton (*A Survey of English Literature, 1780–1880*, New York, 1920, III,286) praises Pater for his strength in keen appreciation of both the body and the soul of literature; that is, of both the ideas and the art of expressing ideas.

MISCELLANEOUS STUDIES

THE CHILD IN THE HOUSE

This history of the progress of a child's mind and spirit is largely autobiographical. Thomas Wright (*op.cit.*, II,80) has pointed out that this sketch and the opening chapters of *Marius the Epicurean* are almost parallel studies. It first appeared in *Macmillan's Magazine*, Aug., 1878, with the title 'Imaginary Portrait: The Child in the House.' In 1894 it was reprinted by Mr.H.Daniel at his private press, Oxford. In 1895 it appeared in the posthumous *Miscellaneous Studies*.

GREEK STUDIES

HIPPOLYTUS VEILED

This essay, one of the most vivid of Pater's synthetic imaginary portraits, appeared in *Macmillan's Magazine*, Aug., 1889. It was reprinted in the posthumous *Greek Studies*, 1895. This study, wrote Pater's biographer, 'is that of the Greek Joseph (Hippolytus), tempted by the Greek "Potiphar's wife" (Phaedra). Virginity, chastity, and celibacy had been, as we have already observed, from his schooldays a favourite theme with Pater. As a youth he had glorified the married virgin Elizabeth of Hungary, and in his prime he raises a trophy to the continent Hippolytus. Son of King Theseus and the Amazonian Antiope, and reared in a sequestered village, Hippolytus had from his childhood been a votary of the great and chaste Artemis. He made for her a little altar, of which he was the little priest — being, indeed, a sort of boy Pater — and even as a young man he could never be induced to put up a prayer to Aphrodite or to cense her altars. Then Phaedra, Theseus's lawful wife, falls madly in love with him, and as he flees from her presence, he is followed by the resentment, not only of Phaedra, but also of the slighted Aphrodite, who, to carry out her revenge, has recourse to Neptune. As Hippolytus is charioteering near the sea, a great breaker, or, as some say, a sea-bull, so startles the horses that he is thrown to the earth and killed; and the moral of it is, if moral there be (though Pater notices it not), that he who flouts nature, as did Hippolytus in refusing to look on the daughters of men (before he met Phaedra), courts and must expect punishment. But perhaps it was as well, for if he had

> Loved girls and song and the soft cadenced beat
> Of golden-sandall'd feet,

he might have offended Artemis, and so come to trouble in some other way.' (Thomas Wright, *op.cit.*, II,4–5.)

JOHN RUSKIN (1819–1900)

CHRONOLOGY

I. *Childhood and University Years* (1819–42)

1819 Born in London on February 8, the only child of James Ruskin (wine merchant) and Margaret Cox, both of Scotch descent; a precocious child, brought up under a rigid system of supervision, without toys, with not infrequent whippings, daily Bible reading and memorizing, with early training in music, drawing, reading aloud, and observing natural objects; his father

very fond of art; his mother reserved, proud, ungracious, and aspiring to rise above her lowly background as daughter of a tavern keeper.

1823 Lived, with his parents, at Herne Hill, then a rural village near Dulwich; read Scott, Pope's Homer, Shakespeare, Byron, *Don Quixote*; wrote verses, dramas, romances, and imitations of the books he read; was taken for the first time, with his mother, on one of his father's business tours, in southwest England, visiting castles, art-collections, churches, lakes, etc. (Tours were an almost yearly event in the rest of Ruskin's life.)

1832–36 Was given a copy of Rogers's *Italy* as a birthday gift (1832), by one of his father's business partners, and was thrilled by the vignettes by Turner in the volume, which proved to be a landmark in the lives of Ruskin and his parents; made his first tour abroad, with his parents, in 1833, to Paris, Geneva, Rome, Pisa, Venice, Chamouni, which furnished the occasion of his first printed prose piece, 'On the Causes of the Colour of the Water of the Rhine,' in *Loudon's Magazine of Natural History* (September 1834); was sent for two years (1834–36) to a day-school at Pechkam; fell in love for the first time (1836), with Adèle Clothilde, daughter of his father's French partner, Domecq, but received chill indifference and ridicule for his uncouth, egoistic, over-intellectual ways; attended courses in literature at King's College, London, and received lessons in art from Copley Fielding (1836).

1837–42 Matriculated at Christ Church, Oxford (1837), his father wishing him to become a bishop; was soon out of harmony with Oxford, indifferent to its intellectual life, his education desultory, broken by frequent tours with his parents (his mother resided in Oxford and supervised his life and health); won the Newdigate Poetry Prize (1839); was threatened with tuberculosis (1840), met Turner, and went abroad, with his parents, for his health; returned to Herne Hill, and met Euphemia Gray (their parents were old friends), in 1841, and wrote for her *The King of the Golden River*; in better health, returned to take his A.B. at Oxford, and then, with his parents, toured France, Switzerland, and Germany; moved to Denmark Hill (1842); decided to defend Turner on the grand scale by writing *Modern Painters*.

II. *The Period of Art Criticism* (1843–54)

1843 Published Volume I of *Modern Painters* (by 'A Graduate of Oxford'), which was attacked by several painters, coolly received by many others, even by Turner, whose fame was in fact already secure; found himself enthusiastically acclaimed by the new Victorian reading public as striking a new note in English prose, and as enabling the ordinary layman to understand something of the nature of art; took his M.A. degree at Oxford; went on a tour with his parents to celebrate the success of his first important work.

1845 Took his first tour alone, to Italy; worked on Volume II of *Modern Painters* (published in 1846); discovered his ignorance of Italian painting (Giotto, Fra Angelico, Orcagna, Gozzoli), and revised certain passages in *Modern Painters*, Volume I, as it appeared in 1846.

1848 On April 10, married Euphemia Chalmers Gray. (Arranged by the parents on both sides, so as to gain a son and a daughter respectively, the marriage was unsuccessful; there was no love felt by either Ruskin or his wife; they travelled, lived in London, moved in society, where Ruskin, the lion of the hour, concealed a deep discontent beneath his labors on architecture, and

where Mrs. Ruskin enjoyed social popularity.)

1849 Published *The Seven Lamps of Architecture*; suspended *Modern Painters*, and began writing *The Stones of Venice*; made two tours, first with his parents, without his wife (to France and Switzerland), the second with his wife and without his parents (to Venice).

1851 Published Volume I of *Stones of Venice*, which had a limited success owing partly to the expensive plates, which gave the work a high price; met with an enthusiastic appreciation by Carlyle for his emphasis on the close relationship between a people's architecture and its morality, religion, and social habits; published the *Construction of Sheepfolds* (a pamphlet urging religious unity); met Carlyle and Maurice; defended, without as yet championing, the Pre-Raphaelites in letters to *The Times*; began to lose his faith in dogmatic religion, owing to the 'dreadful hammers' of the geologists; by the end of the year, began to note the terrible social evils of the age, and wrote three letters to *The Times*, on taxation, the franchise, and education.

1853 Published Volumes II and III of *Stones of Venice*; spent several weeks, with his wife, Millais, and others, in a party at Glenfinlas, in August; a friendship developing between Mrs. Ruskin and Millais.

1854 Ruskin's marriage annulled in July; toured Switzerland with his parents; returned, to become interested in the Working Men's College, in Red Lion Square, London, and to mark the end of an epoch in his life.

III. *The Period of Social and Economic Criticism* (1854–70)

1854–60 Enjoyed considerable power in literary and art circles for his knowledge and criticism of painting, wielding influence through the *Academy Notes*; felt conscious, however, of failure, and began to terminate his art criticism in a series of lectures on art, in the completion of *Modern Painters* (Volumes III and IV, 1856; Volume V, 1860), in the *Elements of Drawing* (1856) and the *Political Economy of Art* (1857); lectured frequently at the Working Men's College.

1858 Met Rose La Touche (aged nine), whose mother, an ardent admirer of Ruskin's work, brought her to Denmark Hill, and with whom Ruskin later fell tragically in love.

1860 Experienced the turning point in his career: published his first attack on political economy in lectures (later known as *Unto this Last*) in the *Cornhill* (August–November), under Thackeray's editorship; met with a storm of abuse and indignation; was obliged to discontinue the series; saw his popularity sharply decline.

1862–63 Published further attacks on the prevailing economy, in *Fraser's Magazine*, under the editorship of J.A. Froude; met with another outburst of denunciation, and the essays (later issued as *Munera Pulveris*, in 1872) had to be discontinued; brooded over his private sorrows, and over the social wrong which he saw about him, and thus began to induce the mental illness which was to assail him periodically.

1864 Mourned the death of his father; delivered as lectures some parts of what is now *Sesame and Lilies*, at Manchester.

1865–66 Published *Ethics of the Dust*, rambling talks given to the girls of a young ladies' school in Cheshire; and *Crown of Wild Olive* (lectures delivered at Camberwell, Bradford, Woolwich, on war, industry, education, honor); began definitely to fail in health, suffering from melancholy and indecision, his condition aggravated by Rose La Touche's refusal to marry

him, by the death of his good friends Mrs. Carlyle and Lady Trevelyan, and by the strain of serving, with Carlyle, on the committee in defense of Governor Eyre.

1867 Published *Time and Tide*; received LL.D. at Cambridge, and delivered the Rede Lecture, on 'The Relation of National Ethics to National Art.'

1869 Rose La Touche still irresolute about marriage, partly because of Ruskin's unorthodox attitude toward religion; Ruskin on the brink of breakdown; published *The Queen of the Air*, lectures on Greek myths; was appointed Slade Professor of Art in the University of Oxford, and accepted in spite of his health and his emotional state.

IV. *Oxford: Minor Economic Experiments: Final Invalid Years* (1870–1900)

1870–75 Ruskin's economic theories still widely unpopular, his fame as a writer and lecturer on art constantly increasing; his health seriously undermined by his enormous labors in many fields of interest (morals, art, economics, education, architecture, geology, mineralogy, mythology, literature), and further undermined by his frustrated love for Rose La Touche, by his loss of faith in the Christianity of his parents, by a life-long warping of his emotional life by the domination of his mother, who as late as 1867 (at the age of eighty-eight) still 'ruled her son and her household with inexorable kindness' (Benson).

1870 Gave his first lectures as Slade Professor; began *Fors Clavigera* (published at intervals from 1871 to 1884), a medley of social, moral, and religious reflections, with many casual thoughts on persons, events, and art; toured Italy; was driven home by the outbreak of the Franco-Prussian War; wrote *Aratra Pentelici* (published in 1872); became dangerously ill; mourned the death of his mother; was reconciled to Rose La Touche; bought Brantwood, on Coniston Lake, which remained his home for the rest of his life.

1871–74 Formed the Guild of St. George (1871); inaugurated a street-sweeping experiment in London (1872); published *The Eagle's Nest* (1872) and the Oxford lectures, *Ariadne Florentina* (1873); started the Hinksey experiment in road-making (1874); toured Italy.

1875–78 Published the early parts of *Proserpina*, also *Deucalion*, and *Mornings in Florence*; re-elected to the Slade Professorship (1876); attacked Whistler in No. 79 of *Fors* (1877), leading to a libel suit; began to suffer mental illness (Rose La Touche died in 1875), an attack of mania occurring February 1878; resigned the Slade Professorship

1878–1900 Resumed *Fors* (1880); made a foreign tour, and began the *Bible of Amiens* (published in 1885); suffered his second mental illness (1881); took the chair at a London lecture, but became ill again (1882); accepted the re election to the Slade Professorship (1883), and lectured on the *Art of England*; lectured at the London Institution on *The Storm Cloud of the Nineteenth Century* (1884); resigned the Oxford Professorship (1885), and began writing his autobiography (*Praeterita*); had his fourth mental illness, July 1885; after much unevenness of health, had his last and most damaging attack in Paris, December 1888; was removed to Brantwood, where, during intermittent periods of clarity and happiness, he continued to write *Praeterita*; fell ill during an epidemic of influenza, and died on January 21, 1900; buried in Coniston Churchyard.

COMMENTARY

'[Ruskin's] part it was to associate the appreciation of beauty in Nature and in art with honest labor and personal design,

as redeemers of the poor from their misery, Philistines from their stupid unloveliness, and both from Shoddy. . . .

'His writings fill thirty-eight volumes on painting and painters, architecture, statuary, on landscape, on geology, botany, mineralogy, books, literature, political economy, national affairs, ancient myth — and himself. Interspersed are many exquisite drawings, sometimes of rare beauty, made by his own delicate hand. Much of his work was amateur, but it was amateurism of a fine sort. He was full of schemes, of which only two or three survived birth. But out of this welter of pen, pencil, and project, rises the essential and sane Ruskin, a major prophet of the doctrine which was to save his own ruling class and times from their stupid and selfish blunders.

'It is usual to point to a sharp reversal in Ruskin's interests at about the age of forty, from painting and architecture to social conditions and welfare. In point of fact the second phase is but the natural fulfilment of the first. At twenty-four came the first volume of *Modern Painters*. The fifth and last appeared when he was forty-one. Meanwhile amongst other works he wrote the *Seven Lamps of Architecture* and *Stones of Venice*. *Modern Painters* was designed ostensibly to reveal and explain the exquisite and deep truth of nature in the landscapes of the painter J.M.W.Turner. Incidentally — or predominatingly — there is much about other painters, literature, the history of culture, about Nature herself in the finest of her workmanship; and the third volume in particular teems with ideas and revelations of loveliness which possess the reader's mind less by stark reason than by their insinuating charm of utterance. The same is true of the *Seven Lamps*, and of parts of *Stones of Venice*. Happy the young man or woman who has felt their spell, whose eye has been opened and feelings sensitized by them to unsuspected forces in art, letters, and Nature, whom they have made self-supporting in his observation and judgment. "Observe" is an habitual word with Ruskin. He insists too that behind all great art there are virtues that make it great — honesty, discernment of truth, nobility, patience and courage, love of order, warm sympathies; and that these enter into great art, and make it great, as human weaknesses likewise vitiate what proves artistically poor or perverted.

'Such inquiries naturally led him to demand why England, and the modern world generally, were no longer capable of great art or susceptible to its influences. So he is confronted, like the other idealists of his time, with the world's absorbing passion for money, its slavery to machines, its consequent hardness of heart, vulgarity, ugliness, materialism, and the brutal degradation of the poor — and all its riches accumulating against the day when they will be burned up in wars of suspicion between the nations. "No nation can last which has made a mob of itself, however generous at heart. . . . Above all, a nation cannot last as a money-making mob; it cannot with impunity — it cannot with existence — go on despising literature, despising science, despising art, despising nature, despising compassion and concentrating its soul on Pence." In the three lectures which comprise his *Crown of Wild Olive* (1864–6), and the four essays of what he considered his best work, *Unto this Last* (1859–60), his trenchant ideas on social conditions find their most eloquent utterance. As earlier from artists and critics, so now again from political economists, his ideas provoked scorn and irritation. In fact they continue so to do in a measure which proves at least their power. It was Ruskin's contention inherited from Carlyle that wealth consists not in material things, but in the character and condition of the possessor — a contention which many professed economists have come to accept.

'Though a man of working ideas rather than practical details — there was the road-making mess with his Oxford lads at

Hinksey — he carried them into form in his organization of St. George's Guild and the Sheffield Museum in 1871, and his experiment, with the help of Octavia Hill, in improving the housing conditions of London's poor. The Guild, on paper — that is in various of the ninety-six letters under the title *Fors Clavigera* (1871–84) — is a Utopia for the reclamation of land by men and women under vows of religious faith, patriotism, and honest kindness to all creatures. It was highly organized under the "Master" (Ruskin self-appointed), and provided with certain picturesque accessories of costume, badge, and practice. Ruskin endowed the Guild with a large slice of his own fortune, and provided for its cultural needs a museum at Sheffield, for which he collected a costly array of minerals and drawings, many by his own hand. The Guild itself came to little, though it still survives past much ridicule, scorn, and discouragement. But no one can measure its vast influence in stirring the present-day enthusiasms and fashions aforesaid, or in shaping the ideals of design, workmanship, and working conditions which are daily becoming realities.

'Ruskin had, and still has, a singular power of enthralling and inspiring his listeners. In spite of his scoldings, his despairs, his egoism, his flashes of unreasoning hatred for railways and other mechanical deformities of modern life, he captivated multitudes in his day. His great repute rose in his early forties, about the time he turned from criticism of art to social questions. A book of "Selections" exhibited purple patches from earlier work, and purple they were. In all his earlier works he was prone at set moments to elaborate a page or two of spectacular prose, pulsing with color, glowing with ornament, in long symmetrical balance of clauses, but borne forward on a strong current of musical cadence. Such occur in "The Mountain Glory" in the fourth volume of *Modern Painters*, and "St. Mark's" in the second volume of *Stones of Venice*. Beneath them rises and falls the regular rhythm of Old Testament English, and of the longer ground swell of Dr. Johnson's essays, which the family used to read aloud to beguile the time on their long journeys, and whose music had entered deeply into Ruskin's impressionable young mind.

'English education was still in large measure oral — Ruskin's especially — and men wrote as if they were speaking, with the sound of their words tingling or thundering in their ears. Some of Ruskin's best writing originated as lectures. For several years he was Professor of Fine Art at Oxford. He was a fluent talker in public and private. All of which accounts for the irresistible but easy momentum of his style. It reflects, too, something of the magnetic presence often described by his hearers — the tall, auburn haired, well groomed figure, rather attractive than good-looking, with the direct, intense, but kindly blue eye, and the invariable blue cravat.

'But his personal power proves itself most in the devoted following which rose in response to his teaching and personality. Ruskin Societies sprang up all around. Books about him still multiply. No other literary man has been honored with so monumental an edition of his works as that by Cook and Wedderburn, with its thirty-eight volumes, its master index volume, and its reproductions of his drawings.

'His purple luxuriance of manner he abandoned when he came to grips with social problems. It enraged him if anyone praised that earlier skill, for he thought it had blinded them to his ideas. The change was to his advantage, for he launched forth at his best with the lithe and unimpeded energy of the stripped athlete in *Unto this Last* and *Crown of Wild Olive*.

'With his other terrible handicaps, he had perhaps too many distracting talents, but out of the litter of his disordered career emerges the single powerful figure of a teacher and prophet who ranks with Car

lyle and Dickens as a regenerator of the Victorian world.'

— Charles Grosvenor Osgood, *The Voice of England*. New York, 1935, pp. 517, 519–22.

'Now in dealing with this strange and beautiful life, so sharply divided into sadness and delight, this character at once so noble and so narrow, so intense and yet so yielding, I want to leave one point very clearly in your minds. The interest of Ruskin's life is the interest of a personality, and I want you to try to regard him in that light, and not either as a prophet, or a reformer, or an art-critic, or a writer. He was all these things by turns — they were but the guises which this restless and ardent temperament assumed. As a prophet, he was unbalanced and unconvincing, because he had depth rather than width of view. He did not see the whole problem. He saw clearly enough into the hearts of like minded people, but he was essentially a partisan, and condemned what he did not understand as severely as he condemned what he hated. He took, from his education and his sheltered life, a meagre view of the world. He had little sympathy with robust strength, and wide tracts of human nature, at its bluntest and soundest, were entirely obscure to him. And thus his reprobation was so extravagant that it made no appeal, not even the appeal of shame and terror, to those whom he inveighed against most fiercely. Then too he did not even do justice to his age; he overlooked one of the best and strongest forces of the time — the resolute search for truth, the stern determination of the scientific spirit not to generalise till it has investigated. He went wrong himself in every department of his work, from his passion for generalisation and his acquiescence in incomplete investigation. What made his protests ineffectual was that he believed himself to have a perfectly analytical mind. His mind was indeed analytical, when he applied it to questions which he understood, and to workers with whom he sympathised. But he had no notion of just comparison, and when his sympathy was not enlisted he could not even analyse. He had the power of putting vague personal preferences into language superficially exact, and this was a terrible snare to him and to his followers, who believed that they were getting logical reasons when they were only getting instinctive predilections. Yet I am far from saying that as a prophet his work was thrown away. He was no ascetic, as I have said, and thus he was able to see the dangers of the materialism that is not uplifted by the concurrence of the soul. But he felt that the invariable comfort in which he lived to some extent invalidated his message. "If I had lived in a garret," he once wrote, "then I could have preached that Queen Victoria should do the same." But as I have said before, he accepted with a sort of unquestioning loyalty the precise standard of material luxury in which he had been himself brought up, and he regarded any extension or development of this as base and degrading. Yet he was here in the main right, because he saw that the bane of the age is its impatience of simplicity, its worship of success, its preference of comfort, and its mistaking the quality of pleasure. . . .

'Ruskin attained his position in the literary world, and in the view of many worthy persons maintains it now, by work that was not only inferior, but was pervaded by gross faults of dogmatism, erring knowledge and baseless judgments. His best work is still to a great extent unappreciated and unpraised, his genius hardly suspected. The British public wanted correct information, impressive argument, and conventional conclusions. What was the joy of that stolid and pathetic clientèle, when it found a man who could bully them into thinking that they cared about art, tell them exactly what pictures to buy and what to neglect, give eloquent reasons which made them be-

lieve they had gone to the bottom of the matter, and then — the crowning joy of all — tell them with thunders of conviction that the old moral law held good there as everywhere, that the bad man was the bad artist and the good man the good artist. It was a prodigious and colossal error; but it went straight to the heart of the nation; it confirmed the Psalms of David and the law of Moses; it fitted in, or so they thought, with the teaching of the Gospel and St. Paul. . . . The enthusiasm of the public knew no bounds, because not only did it issue from a graduate of Oxford, and thus had the stamp of academic culture, but it was a conclusion worthy of a sermon, with this additional advantage that it was not a statement made by a clergyman from a pulpit, and thus open to a suspicion of professional motive, but made by a layman in a book of art criticism, and was thus a confirmation of the most respectable sort of morality, from a source which might naturally have been liable to a charge of dangerous bohemianism. . . .

'And then came the years when he seemed to throw aside wantonly and quixotically all the influence he had gained, and to flourish in the face of the public all sorts of crazy fancies and impossible dreams. In these years he was greatly discredited, though at last the sale of his books went up by leaps and bounds. The most charitable hypothesis freely indulged was that he was out of his mind. Nothing else could account for such ludicrous sincerity and such delirious schemes. But by this time many true spirits had discerned him rightly, and saw that if he was fallen into a passion of irritability and disgust, he was crazed not by disease but by the pressure of desperate thoughts. Perhaps his Professorship a little rehabilitated him in the eyes of the outer public. And then he did what is the most popular thing that one can do in England, an act which sets the crown upon any amount of even inefficient endeavour: he grew old, and became a public pet — a grand old man. . . .'

— A. C. Benson, *John Ruskin*. London, 1911, pp. 201, 253, 255.

NOTES

MODERN PAINTERS

'As soon as [Ruskin] returned from what seems to have been his fifth visit to the Alps, and had put on his bachelor's gown at Oxford, he settled down at home in Herne Hill to write his *Modern Painters* in the autumn and winter of 1842, he being then twenty-three. Each piece when finished was read aloud to the father and mother and cousin Mary, and would even draw tears of joy from the doting parents. . . . Brimful of the Alps, of the mountains, lakes, castles, and churches of the Rhine, Switzerland, and Italy, Cumberland, and Perthshire, the personal friend of Turner, the possessor of some of his best pieces, the pupil of Copley Fielding and Harding, the honorary class-man of Oxford and prize poet, he now fell with zeal

to enlarge his . . . pleading for Turner. . . . The dominant idea of his trumpet call to painters was to fling aside the traditions of the Academies, to go humbly to Nature, rejecting nothing, selecting nothing, scorning nothing. . . . Canaletto, Poussin, and Claude . . . were blind leaders of the blind. . . . Turner had given all the facts — trees, rivers, sea, clouds, mountains, details, colour, and impression — but all transfigured with his own poetry of magical sight. . . . [Ruskin's] doctrine was infused with reminiscences of Greek philosophy; of Aristotle's warning to be certain of what we know by proof; of Plato's war against the false knowledge of the sophists and their love of fine phrases instead of evidence; of Bacon's revolt against the schoolmen; and Locke's repudiation of traditional "authority"; — and it was set forth with a splendour of declamation and a torrent of illustration, with word-pictures and word-scourges, such as had never yet been dreamed of in the stolid commonplaces of conventional criticism. . . .

'The book was finished in the winter, and was published in May 1843. . . . As it was thought, especially by the wary father, likely to be regarded as presumptuous in a young man of twenty-four [to present "all the dogmatism, self-confidence, fighting, and chivalrous temper of the new gospel"], the author's name was suppressed, and the book was signed by "A Graduate of Oxford."' (Frederic Harrison, *John Ruskin*, pp.41–44.)

'The public then "cared little for Turner." . . . But Turner had become a Royal Academician nearly twenty years before Ruskin was born. He was famous and wealthy long before Ruskin's book appeared. Ruskin did not discover Turner in the sense that he discovered Carpaccio and re-discovered Tintoret. . . . He rescued him not from obscurity, but from misunderstanding. He was not the first to praise Turner, but he intervened in order that he should be praised rightly. . . . Want of truth to nature was what Turner had been accused of; and the truth of Turner was therefore the point which Ruskin laboured in his defence. Truth, that is, of form; not necessarily of topography . . . In the work of discrimination [among Italian paintings] Ruskin was a pioneer . . . In the field of landscape, the Dutch and the French masters of the seventeenth century were the accepted models. It was by their standard that Turner was found wanting; to clear the ground for Turner, he sought to demolish the others. This led him, no doubt, into some exaggeration of blame and into excess of emphasis. . . . In bringing works of landscape art to the test of nature, he was led into many a golden page of descriptive writing. . . . He recorded, analysed, and compared the appearances of nature, not merely in glowing language, but with scientific precision. Such studies in connexion with art had, when Ruskin began to write, a note of originality.' (E.T.Cook, *Life of John Ruskin*, I,138–44.)

'The appearance of [the book] produced a real sensation in the artistic, and even in the literary world. The recognised organs of criticism were hostile and contemptuous. The painters whom he had criticised and praised were not all satisfied with qualified eulogium; and Turner was rather overwhelmed by the zeal of his young friend. But men of insight saw in it a new idea.' (Harrison.) It drew enthusiastic praise from many of the literary leaders of the day: Wordsworth, Sir Henry Taylor, Samuel Rogers, Aubrey de Vere, Miss Mitford, the Brownings, George Eliot, Charlotte Brontë, Jowett, and Tennyson. More notably it had a fructifying effect on certain young artists: 'it is a thing to cherish,' writes Cook, 'this picture of the [subsequently] great Pre-Raphaelite painter [Holman Hunt] burning the midnight oil over a borrowed copy of *Modern Painters*. . . . William Morris and Burne-Jones and others of their set [at Oxford] got at Ruskin's book, and Morris would

give out favourite passages from the first volume as they have never been given before or since. "He had a mighty singing voice and chanted rather than read those weltering oceans of eloquence. The description of the Slave Ship, or of Turner's skies, with the burden 'Has Claude given this?' were declaimed by him in a manner that made them seem as if they had been written for no end but that he should hurl them in thunder on the head of the base criminal who had never seen what Turner saw in the sky." ' (Cook, I,147.)

Volume II of *Modern Painters*, 'very much less glittering than the first,' and 'overlaid with dogmatic theology,' appeared in the summer of 1846. It had great contemporary value as 'the best guidebook to Italian pictures of the time up to and including Tintoretto.'

By the time Volumes III and IV were published in 1856, Ruskin had become interested in the economic and social problem of the age, as is evident in many passages in *Stones of Venice* (1851, 1853). In the third volume, he attempted to wind up his art criticism, in order to devote his mind to what he considered to be the more fundamental tasks of the day. But what was intended to become a volume became three, and the fifth volume appeared in 1860. Volume III shows Ruskin adopting a less systematic method. His chief aim is to answer the charges of inconsistency levelled at him by critics of the first two volumes. The result is a highly miscellaneous volume, rich in illuminating digressions and provocative propositions. In it Ruskin's central position is as follows: that art is the greatest which expresses the greatest number of the noblest ideas. Art is the expression of an artist's soul, through imagination, which is the mind's eye seeing truthfully and recording only such detail as adequately expresses or 'realizes' the object. It is in the second half of the volume that Ruskin's most brilliant, if sometimes erratic, analyses occur: his sketch of the influence of landscape, his discussion of the 'pathetic fallacy,' his occasional excursions into literary criticism, his memorable analysis of the 'modern temper' (Chapters XVI and XVII).

'Upon the completion of *Modern Painters*,' writes Cook, 'Ruskin's reputation, if the voice of the public organs of opinion be the test, stood at its highest point. His literary career . . . had been steadily progressive in popular applause. He had created the taste by which he was to be admired.'

THE SEVEN LAMPS OF ARCHITECTURE

This work occupied Ruskin during the winter of 1848–49, and was published in the spring of 1849, making as great a sensation as the first volume of *Modern Painters*. It is the work, however, which, of all his volumes, Ruskin most vehemently criticised: 'the utterly useless twaddle of it, the shallow piety and sonorous talk, are revolting to me,' wrote Ruskin when, about 1870, his publisher suggested that he revise it with a view to reissue. Yet, marked as it was by dogmatism and 'narrow and impertinent theology,' it was hailed as a 'hymn to architectural loveliness'; though it 'bristled with paradoxes, contradictions, sophisms, and wild hypotheses,' it was in fact 'the first treatise in English to teach the significance of architecture as national biography.' Moreover, there lay imbedded in the luxuriant rhetoric of the book a new theme which was to transform Ruskin the art-critic into Ruskin the social prophet: 'Ruskin's mind,' says Cook, 'was already at work along the lines on which he afterwards based his teaching at Oxford; he was connecting architecture with social reconstruction. . . . The implications of [many] passages were not lost upon some of Ruskin's reviewers when *The Seven Lamps* appeared, and his old enemy *Blackwood's Magazine* was puzzled and sarcastic at his "breaking loose" in "so startling a manner." ' The book was the product of one of the most tumultuous

years of the nineteenth century, the year of the Chartist petition, and of revolutions in France, Germany, Italy, and Austria.

The chapter on 'The Lamp of Memory' is noteworthy not only for the reasons indicated but also because, in dealing with the problem of 'restoring' old buildings, it reveals how intimately the book touched upon a movement it was to influence immensely, namely, the Gothic Revival in architecture.

STONES OF VENICE

On Ruskin's purpose in writing this work, see paragraphs 65 and 66 of the second lecture in *The Crown of Wild Olive*. The book was one of the most rapidly executed and most complete of all Ruskin's works. The first volume was composed in Venice and London in 1849–50, and was published early in 1851. In Venice he plunged into a minute study of the Ducal Palace, St. Mark's cathedral, and other public buildings, made exact drawings and measurements, took copious notes, and, by meticulous research, sought out the dates, sources, and origin of each fragment — colonnades, balconies, capitals, balustrades — 'literally,' as Harrison remarks, 'the *stones*, not the buildings, of Venice.' After he had made another long stay in Venice, in 1852, the second and third volumes appeared in 1853. Considerable controversy was aroused over the publication of Volume I (1851): to be sure, the Great Exhibition in the Crystal Palace was making men conscious of the relation of the arts to the life of the nation, but there was also the 'battle of the styles' in architecture, and Ruskin's championship of Gothic did not find favor in all eyes. Volumes II and III met a more enthusiastic reception, and readers admired the organic coherence of the whole. *The Stones of Venice*, especially in the second and third volumes, is definitely an introduction to Ruskin's second career, as Socialist reformer, which began about 1860 with *Unto this Last*. Like his previous works, it is immensely informative, and, like them, suffers from the radical defects of Ruskin's entire teaching: 'He undertook,' wrote Harrison, 'to found a comprehensive scheme of the imaginative faculties on a creed which he had imbibed as a child and held with childlike fervour, without any solid study of its philosophy, or its history, or its social fruits.' His condemnation of the 'foul torrent of the Renaissance' was far too largely a rationalization of his need to buttress the Puritanism in which he had been reared, and which he hoped to see eloquently vindicated in Gothic architecture. Chapter six of Volume II remains memorable, however, for Ruskin's definition of Gothic (which was to influence the growth of 'Victorian Gothic'), and for his famous passage about the mental slavery of the modern workman, which, to some extent, was the origin of a new industrial school of thought.

UNTO THIS LAST

'[Ruskin] was in debate within himself, as passages in the last volume of *Modern Painters* show, how far he could honestly or with any inward satisfaction pursue the cultivation of the beautiful in art, without first endeavouring to realise the good and beautiful in the world of social and political life. It was with such thoughts surging in his brain and such feelings burning in his heart that he had gone, in the summer of 1860, to the mountains; and there, under the same "cloudless peace of the snows of Chamouni" that had inspired and sanctified his earlier essays in art, he now turned his mind to theories of national wealth and social justice. Into these essays Ruskin put the results of much long and earnest thought, and to them he brought all the resources of a now matured and chastened style. Every word of *Unto this Last* was written out twice, he tells us, and "in great part of the book, three times." His views ran counter to accepted beliefs, and he expected reprobation. . . .

'By the end of June Ruskin had his first

essay, or perhaps more, ready for the printer, and he offered it to the new magazine — the *Cornhill*. . . . The publication of the papers in the *Cornhill Magazine* raised a storm of indignant protest. . . . [They] were described by the *Saturday Review* as "eruptions of windy hysterics," "absolute nonsense," "utter imbecility." . . . After the receipt of the third paper, which appeared in October, the Magazine, he was informed, could admit only one Economical Essay more, which, accordingly, he made (by permission) longer than the rest. Also, stronger. "I'm so glad," he wrote to William Ward on October 1, "you like these economy papers. The *next* will be a smasher. — I'm only afraid they won't put it in. If they don't, I'll print it separate."

'Ruskin had faith in the ultimate vindication of his essays; but at the time the stoppage of them in the *Cornhill*, and the violent reprobation with which they were received, caused him much disappointment and bitterness of spirit. Eighteen months later (June 1862) he collected the essays, unaltered, but with an added preface, into a separate volume. The book not only sold very slowly itself, but its heresies checked the sale of his other books also. . . . Ten years later [the first edition of 1000 copies] was still not exhausted. . . . A few years later, Ruskin re-issued the book on his own account, and the rate of sale during the following thirty years [until about 1900] was 2000 per annum.' (Cook, II,4–5,6,8,13–14.)

In 1860, Victorian public opinion concerning 'political economy' was such that Ruskin was regarded as a heretic no less in advocating practical extensions of State interference than in attacking the dogmas of *laissez faire*. Many of his 'heresies' have now become accepted doctrine. In the late-Victorian decades his book played a great part in the formation of opinion in the British Labour Party. When the Labour Members of the Parliament of 1906 were asked by an enterprising journalist what books had most influenced them, *Unto this Last* appeared in the greatest number of lists.

As a work of literary art, *Unto this Last* has won high praise for its pure, incisive, imaginative, lucid style, its clearness, wit, eloquence, versatility, and passion. Ruskin has 'shed the flamboyance and prolixity of his youth' and here wields his style like a swordsman: 'keen, rapid, and lustrous, flashing with swift easy turns through impassioned pleading, succinct exposition, searching irony and fanciful humour.' (J.W.Mackail.)

The title is a phrase from *Matthew*, xx, 14.

MUNERA PULVERIS

'After a winter among the Alps, . . . [Ruskin returned home, in February 1862, and] found that his political economy work was not such a total failure as it had seemed. Mr. Froude, then editor of *Fraser's Magazine*, thought there was something in it, and would give him another chance. So, by way of a fresh start, he had his four *Cornhill* articles published in book form; and almost simultaneously, in June 1862 the first of the new series appeared. . . . In September the second article appeared in *Fraser's*. "Only a genius like Mr. Ruskin could have produced such hopeless rubbish," says a newspaper of the period. Far worse than any newspaper criticism was the condemnation of Denmark Hill. His father, whose eyes had glistened over early poems and prose eloquence, strongly disapproved of this heretical economy. . . . In December the third paper appeared. History repeated itself, — as usual, with variations. This time not only the public but the publisher interfered; and with the fourth paper the heretic was gagged.' (W.G.Collingwood, *The Life of John Ruskin*, London,1900, pp.201–02.)

Munera Pulveris, which ultimately appeared as a volume, in 1872, rests upon the same general idea that the 'political economists' mistakenly assumed that men are

moved by none other than selfish motives. Ruskin holds that since societies are exceedingly complex organisms, their acts and purposes can be rationally understood only when a dangerous and false simplicity is avoided. The book is considerably more constructive and more comprehensive than *Unto this Last*, but Ruskin was too much the desultory, self-taught, impulsive student of poetry and the arts for the task he set himself: the outlines of a social philosophy. Yet Ruskin does go to the root of the matter, in his characteristically swift and graphic way, by showing that there can be no rational political economy apart from a comprehensive sociology.

The title, says Cook, 'is one of the most obscure in his series, and even learned commentators dismiss it with the bald remark that it is cryptic. As the Ode from which it comes is one of the most vexed passages in Horace, the title admits of a large number of conceivable interpretations. [Ruskin's] chief purpose in *Munera Pulveris* is to attack the conception of wealth . . . which takes "dust for deity," which leads men to "gather dust for treasure." The title of the book expresses the fallacy which it is meant to expose, and may be translated as Gifts, or Functions, of the Dust.' (Cook, II,55.)

Munera Pulveris was dedicated to Carlyle, who had been among the minority who praised *Unto this Last*, and who now wrote to Ruskin's father and to Ruskin himself to praise the essays for their clarity, calmness, and justness.

SESAME AND LILIES

In 1864, after the death of his father, Ruskin, 'having no specific work on hand, devoted himself to lectures in many places, in all of which Art was made subordinate to ethical and social ideals. It was during this time that he gave the two lectures at Manchester, in 1864, "Of King's Treasuries" and "Of Queen's Gardens," which, with the Dublin lecture of 1868, on "The Mystery of Life and its Arts," was subsequently known as the volume so oddly named *Sesame and Lilies*, 1871, . . . the most popular of all his minor works.' (Harrison, *John Ruskin*, p.111.)

'The titles "Sesame" and "Lilies," given to lectures on the influence of good books and of good women respectively, were pieces of Ruskin's shorthand. . . . By the first title he meant to indicate that his lecture dealt with the cultivation of the spirit which opens the door to the secrets of good literature. He who can read a true book aright has an "open Sesame" to audiences with the great and wise of all time. . . . The sub title of the lecture, "Of Kings' Treasuries," fits in with [his] meaning of "Sesame"; but Ruskin had another train of thought in his mind, as indicated by a motto from Lucian. . . . The sesame-cake is promised, in Lucian's Dialogue of *The Fishermen*, as a bait to the philosophers. . . . It is to the simpler life, far removed from the restless pursuit of material wealth, that Ruskin summons all those who hear him.' (Cook, II,91-92.)

In the first two lectures of the volume, 'we can hear the echo of Carlyle's talk, in the heroic, aristocratic, Stoic ideals, and in the insistence on the value of books and free public libraries, — Carlyle being the founder of the London Library.' (Collingwood, p.212.)

'"The Mystery of Life and its Arts" is the most important, most personal, and most thoughtful of all [in the volume]; indeed [it] contains much of Ruskin's most memorable work. It is full of sadness, of religious musing, and of passionate exhortation to work out a social reformation, to feel the mystery and the power that lies dormant in each human soul, and more passionate reprobation of the materialism and selfishness which society breeds in our generation so as to hide the mystery and to pervert that power. The homily is full of personal confessions, of disappointment, and failure. It is a sad tale. The ten best years of his life given to Turner had proved in vain. . . . The so-

cial diseases of our age had made men incurably blind to the higher uses of [painting and architecture]. The arts can never be right unless their *motive* is right. And modern civilisation makes us insensitive to high motives and apathetic to noble aims. "The reckless luxury, the deforming mechanism, and the squalid misery of modern cities" make great art an impossibility, and thought given to it a mockery.' (Harrison, pp.113–14.)

THE CROWN OF WILD OLIVE

This work was originally a series of lectures: the first, on 'Work,' was delivered at Camberwell in January 1865; the second, on 'Traffic,' at Bradford in April 1864; the third and fourth, on 'War' and on 'The Future of England,' in Woolwich, at the Royal Military Academy, and Institution, respectively, in February 1866 and December 1869. The wild olive was the prize of the victor in the Olympic games of ancient Greece; for Ruskin it means, as he says in his Introduction (§ 16), 'type of grey honour, and sweet rest.' The lectures contain some of the most eloquent passages in Ruskin's works, and frequent penetrating remarks on trade, industry, conduct, education, work, and honor.

Modern Painters, *Seven Lamps*, and the *Stones of Venice* had all been expensive books, and therefore limited in sale and public recognition. *Unto this Last* was cheap enough, but unpopular because of its theme. But with the publication of *Sesame and Lilies* and *Crown of Wild Olive*, Ruskin became a widely popular writer. The following year (1867) his work received a public compliment, in his being given an Honorary Degree at Cambridge. Ruskin was pleased to write to his mother that the Public Orator 'dwelt more on The Crown of Wild Olive than on any other of my books.'

TIME AND TIDE

Between March and May 1867, Ruskin's 'ideas about a reconstruction of social institutions and habits were scattered, in a desultory and eager way, through the twenty-five letters addressed to a working cork-cutter of Sunderland [Thomas Dixon] . . . on the occasion of the Reform agitation of that time, and published under the title of *Time and Tide*. The idea of the series was to urge working men to consider not merely the question of the suffrage, but the reform of laws bearing upon "honesty of work and honesty of exchange." As usual, he branches out into a mass of startling proposals and sweeping anathemas. . . . These "Letters" are indeed not so much a social Utopia as the passionate sermons of a religious enthusiast; and not more practicable than those of John the Baptist, Saint Francis, Savonarola, or George Fox. Scattered through them are noble, wise, and memorable sayings — what Carlyle called his "fierce lightning bolts" — flashed forth from his "divine rage against falsity." . . . The account of the four modes in which the Bible is regarded in our day [1902] is true and admirably put; and here, perhaps, we get the first plain statement of the extent to which he had parted with his mother's rigid Calvinism. . . .' Sixteen years before, on publishing the *Stones of Venice*, and in seeking to prove to the world that 'all great art is essentially religious, John Ruskin proved to himself that the Puritan type of religion in which he had been trained, and which he fervently believed till the full age of manhood, would not stand the test; and when he began to modify and recast it, he found himself naturally in very deep waters. . . . It is true that in the decline of his mental stamina, Ruskin emerged from the theological darkness in which he groped through middle life into a rather vague form of orthodox belief.' (Harrison, pp.104,105,71,72,etc.)

In spite of the unevenness of *Time and Tide*, it has been regarded by many critics as the 'best summary of the author's social and economic program.' As a vehement reply to the Reform agitation of 1867,

it merits comparison with Carlyle's *Shooting Niagara.*

FORS CLAVIGERA

'The first letter of *Fors Clavigera* was dated from Denmark Hill 1st January 1871, and it announced [Ruskin's] descent into the arena of practical socialism. "For my own part," he wrote, "I will put up with this state of things passively not an hour longer. . . . I simply cannot paint, nor read, nor look at minerals, nor do anything else that I like; and the very light of the morning sky has become hateful to me, because of the misery that I know of, and see signs of, where I know it not, which no imagination can interpret too bitterly. Therefore I will endure it no longer quietly; but henceforward, with any few or many who will help, do my poor best to abate this misery." On the 1st of May 1871, in Letter V. of *Fors* — a letter which Carlyle hailed as "incomparable; a quasi-sacred consolation to me, which almost brings tears into my eyes!" — Ruskin expounded the scheme of St. George's Company. . . . It was in spirit Mediaeval, but purged from the cruelty of Feudalism and the superstition of Catholicism. It was to be neither Communist nor Monastic; for it was to carry to the highest point of development the institutions of hereditary property and of family life. . . . The scheme rested on the central ideas on which Ruskin's whole philosophy was based — (1) That there could be no civilisation without practical religion; (2) no prosperity apart from labour on the soil; and (3) no happiness without honesty and truth. The task of St. George was to slay the dragon of Industrialism; to deliver the people from all the moral and physical abominations of city life, and plant them again on the soil of an England purified from steam, from filth, and from destitution. . . .

'[The letters in *Fors Clavigera* are] autobiographical, desultory, incoherent, self-revealing, personal to a degree of which there is hardly any equal example in our language; and they are composed in a style in strange contrast to that of the art studies which made the name of Ruskin famous in the whole reading world. . . . If we look calmly at all these ninety-six Letters taken together, we shall see a very definite purpose and plan running through the whole: the revelation of a mind of marvellous brilliancy, richness, and culture; of a nature of exquisite tenderness, generosity, and candour. *Fors* is Ruskin's *Hamlet*. . . . [In it there is] not a trace of rhetoric, word-painting, or laboured composition in any form. It is throughout a masterpiece of simple, graceful, pellucid English, like the most easy and natural speech, . . . a style of unmeasured *abandon*, of surrender to any fancy, whim, association of the passing moment. . . . There is a kind of gentle humour, of fantastic waggery in the phrasing, which is pleasing and quaint, takes it out of the ruck of mere balderdash, and places it in line with the playfulness of genius. The tone is at heart that of Swift in *Lilliput*, or of Carlyle in *Sartor*, or of Thackeray in the *Book of Snobs*. . . . *Fors* is a satire on modern life, cast in a form of graceful trifling. . . .

'[Ruskin's] famous experiment [in selling *Fors*] was started in 1871 with the first number, . . . which was not to be published in the usual way, but was sold only by Mr. George Allen at a village in Kent. It was not advertised, there was no discount, no abatement, the price was sevenpence, afterwards raised to tenpence. In spite of these obstacles, thousands were sold of each number. . . . [Ruskin's] aim was to offer, without any middleman, or advertisement, or commendation, a sound article at a price that would pay fully all the workmen employed on it, putting aside all competition, trade usages, commissions, or rebate. . . . That *Fors* should have been sold by thousands under conditions so troublesome and unusual, that immense issues of the costly volumes should have

found buyers, was an extraordinary tribute to the author's popularity. . . . At last the books were printed in a style less sumptuous, and sold at prices more modest. . . .' (Harrison, pp.166–67,170,171,181,182,184–85,168,169, etc.)

'The reader was always to remember that "Fors is a *letter*, written as a letter should be written, frankly, and as the mood or topic chances." The "Letters" were addressed "To the Workmen and Labourers of Great Britain," but this was an address which Ruskin did not intend in the ordinary sense of the words. He wrote for all "fellow-workmen" with him, . . . including, as he explained, "masters, pastors, and princes" no less than the rank and file. . . .

'The criticism of the nineteenth century which runs through the book from its first page to the last is deeply coloured by the influence of Carlyle. . . . *Fors Clavigera* may be described, under one aspect of it, as a resumption, at the latter part of the century, of the contrast between *Past and Present* which Carlyle had drawn three decades before. . . .' (Cook, II,314,320–21.)

ALEXANDER SMITH (1830–67)

CHRONOLOGY

1830 Born at Kilmarnock in Ayrshire on December 31, son of a designer of patterns for lacework; destined for the ministry, but on leaving school was apprenticed to his father's trade.

1853 Published *A Life-Drama*, after a period of journalism and poetry in Edinburgh, and publications in the (London) *Critic* and the *Eclectic Review*.

1854 Became secretary to Edinburgh University; gained sudden and rapid fame by his poetry, which was compared to the poetry of Tennyson and Keats; was satirized as a member of the 'Spasmodic School' of poets (with P.J.Bailey and Sydney Dobell) in W.E.Aytoun's *Firmilian: a Spasmodic Tragedy*.

1855 Collaborated with Sydney Dobell on *War Sonnets*, inspired by the Crimean War.

1857 Published *City Poems*, which had little success; married Flora Macdonald; suffered poverty.

1861 Published *Edwin of Deira*; was accused (almost certainly unjustly) of plagiarism, since the theme of chivalry in *Edwin* came just at the time of the appearance of Tennyson's *Idylls of the King*.

1863 Published *Dreamthorp*, his first prose volume, containing twelve essays, a few reprinted from periodicals; continued still under eclipse from the charge of plagiarism; found his work no longer enthusiastically accepted, and *Dreamthorp* neglected.

1865 Published *A Summer in Skye*, a volume of prose on the life and beauties of Skye.

1866 Published two novels: *Alfred Hagart's Household*, and *Miss Oona McQuarrie*, the former winning considerable popularity.

1867 Died of typhoid fever on January 5.

Posthumously published: *Last Leaves* (1868), edited by Patrick Proctor Alexander, with a memoir.

COMMENTARY

'. . . Alexander Smith's work as an essayist . . . must be judged by the two volumes *Dreamthorp* and *Last Leaves*. . . . His place is in the group which contains Lamb, and the Thackeray of the *Roundabout Papers*, and R. L. Stevenson; and his position relatively to them must be determined by the quality of such pieces as *Dreamthorp* and *A Lark's Flight* and *An Essay on an Old Subject*. Merely *qua* essayist, he stands higher than men like Carlyle and Macaulay, who in other respects are much greater than he. Their papers are in the main essays by the accident

that their authors did not choose or had not leisure to expand them into histories. . . .

'. . . What is indispensable is that the essayist must create an atmosphere which he himself pervades, as the odour of the flowers of summer fills the air. We feel Lamb in every one of the *Essays of Elia*; and we feel Alexander Smith all through *Dreamthorp*. The fact that he founds his greatest essay on an incident in his boyhood is trivial; but that *A Lark's Flight* throughout is full of the personality of the writer is not trivial. The title-essay *Dreamthorp* is charming because it gives a highly skilful description, or rather interpretation, of a place rich in associations of old Scottish history, but more charming still because it is so emphatically the place as seen with one particular pair of eyes. "Come and see it *with me*," is Smith's invitation to the reader; and the reader accompanies him and sees that which would probably be invisible to him if he took the canal-boat and got out at the wharf, for we are told that the railway does not come near. . . .

'. . . In prose as well as in verse his work is essentially poetic. He had that insight, more penetrating than the insight of common men, which marks the true poet; and therefore his confidences are light thrown upon dark places. . . .'

— Hugh Walker, ed. *Dreamthorp, with Selections from 'Last Leaves,'* Oxford, 1934 (World's Classics), pp. xiii–xix.

ROBERT LOUIS STEVENSON (1850–94)

CHRONOLOGY

1850 Born November 13, at Edinburgh, only child of Thomas Stevenson, civil engineer, and Margaret, daughter of the Rev. James Balfour; religious by training and nature; suffered severe illness of the lungs, but showed his mother's cheerful disposition.

1857–67 Early schooling interrupted by illness and travel; read much and wrote much; attended a private school in Edinburgh (1864–67); edited a school magazine; traveled to various parts of the continent; published a pamphlet, *The Pentland Rising, a Page of History, 1866* (1866).

1867–75 Entered Edinburgh University (1867); received medal for a paper on improvements in lighthouse equipment, but (1871) gave up engineering, because of frail health; studied law; did much writing, some for the short-lived *Edinburgh University Magazine*, which he and college friends had begun; was called to the bar (1875), but never practised.

1875–79 Contributed to magazines; pub-

lished in *Cornhill Magazine* essays collected as *Virginibus Puerisque* (1881) and *Familiar Studies of Men and Books* (1882); had many literary friends in London; made a canoe-trip in Belgium (1876), described in *An Inland Voyage* (1878); made journey (1878) described in *Travels with a Donkey in the Cévennes* (1879); published short stories (1878), some collected as *New Arabian Nights* (1882).

1879–80 Followed Mrs Osbourne to California, traveling by emigrant ship; continued writing, though ill; married Mrs. Osbourne (1880).

1880–87 Returned to Edinburgh with his wife; continuously in poor health, traveled on the continent and in Scotland, working persistently; wrote *The Treasure of Franchard*, *The Black Arrow*, *A Child's Garden of Verses*, *Prince Otto*, *The Silverado Squatters*, a second series of *New Arabian Nights*, several short stories, essays, and, with his friend W.E.Henley, several plays; financially relieved for a time by the success (1886) of *The Strange Case of Dr. Jekyll and Mr. Hyde* and *Kidnapped*; after 1884 at home in Bournemouth, England.

1887–88 Left, with mother, wife, and stepson, for Colorado, in hope of health; stopped at Saranac Lake, New York, till April, 1888, writing essays for *Scribner's*, and *The Master of Ballantrae* (1889); subsidized by an American publisher, went with his family to the South Seas.

1888–94 Spent a half-year at Honolulu; finally settled in the Samoan Islands (1890); called his mountain-side home Vailima; championed the natives, and was beloved by them; worked industriously, writing *The Wrecker* (1891), and *Catriona* (1893—later entitled *David Balfour*); published *Across the Plains* (1892), a collection of essays; *Island Nights' Entertainments* (1893); *The Ebb-Tide* (1894); left several works unfinished: *St. Ives*, *Weir of Hermiston*, *A Family of Engineers*, etc.

1894 Died of cerebral hemorrhage, December 3, at Vailima.

COMMENTARY

'. . . Stevenson was to become a novelist, not a writer of systematic treatises upon ethics or sociology. The impulses, however, survived in various forms. They are shown, for example, in the striking essay called *Pulvis et Umbra*. It is his answer to the pessimistic view of men considered as merely multiplying and struggling units. Everywhere we find that man has yet aspirations and imperfect virtues. "Of all earth's meteors," he says, "here, at least, is the most strange and consoling; that this ennobled lemur, this hair-crowned bubble of the dust, this inheritor of a few years and sorrows, should yet deny himself his rare delights and add to his frequent pains and live for an ideal, however misconceived." This view implies his sympathy with the publican as against the Pharisee. We should cherish whatever aspirations may exist, even in the pot-house or the brothel, instead of simply enforcing conformity to the law. We should like the outcast because he is, after all, the really virtuous person. To teach a man blindly to obey public opinion is to "discredit in his eyes the one authoritative voice of his own soul. He may be a docile citizen; he will never be a man." The sanctity of the individual in this sense explains, perhaps, what was the teaching in which Walt Whitman and Mr. Herbert Spencer seemed to him to coincide.

'The "philosophy" is the man. It is the development of the old boyish sentiment. Disease and trouble might do their worst; the career of the "pirate," or even more creditable forms of the adventurous, might be impracticable; but at least he could meet life gallantly, find inexhaustible interest even in trifling occupations when thrown upon his back by ill-health, and cheer himself against temptations to

pessimistic melancholy by sympathy with every human being who showed a touch of the heroic spirit. His essay upon the old *Admirals* is characteristic. His heart goes out to Nelson, with his "peerage or Westminster Abbey," and even more to the four marines of the *Wager*, abandoned of necessity to a certain death, but who yet, as they watched their comrades pulling away, gave three cheers and cried, "God bless the King!" In *Aes Triplex* he gives the same moral with a closer application to himself:

'"It is best," he says, "to begin your folio; even if the doctor does not give you a year, even if he hesitates about a month, make one brave push, see what can be finished in a week. . . . All who have meant good work with their whole heart have done good work, although they may die before they have the time to sign it. . . . Life goes down with a better grace foaming in full tide over a precipice, than miserably struggling to an end in sandy deltas." That, he explains, is the true meaning of the saying about those whom the gods love. At whatever age death may come, the man who dies so dies young.

'This gallant spirit, combined with extraordinarily quick and vivid sympathy, gives, I think, a main secret of the charm which endeared Stevenson both to friends and readers. His writings showed anything but the insensibility to human sorrows of the jovial, full-blooded athlete. It must be admitted, however, that if he did not ignore the darker side of things, he disliked dwelling upon it or admitting the necessity of surrender to melancholy, or even incorporating such thoughts in your general view of life.' (Leslie Stephen, *Robert Louis Stevenson: An Essay*, New York[1903], pp.27–31.)

NOTES

VIRGINIBUS PUERISQUE

AES TRIPLEX

This essay was printed in the *Cornhill Magazine*, April, 1878, and included in *Virginibus Puerisque* ('For Girls and Boys'), 1881, Stevenson's earliest volume of collected papers.

'I began to write these papers,' wrote Stevenson, in his Dedication, 'with a definite end: I was to be the *Advocatus*, not I hope *Diaboli*, but *Juventutis*; I was to state temperately the beliefs of youth as opposed to the contentions of age. . . .' He hoped he might call the volume *Life at Twenty-five*. He was unable to hold to his plan, but 'a good part of the volume would answer to the long-projected title.' The volume has been termed 'a layman's contribution to a philosophy of youth,' and this particular essay 'perhaps the most cherished of all philosophic essays in English' because of its irrepressible courage — especially since Stevenson fought a life-long fight against the affliction of ill health.

MEMORIES AND PORTRAITS

PULVIS ET UMBRA

This essay was printed in *Scribner's Magazine*, April, 1888, and included in the volume *Across the Plains*, 1892. In the collected edition of Stevenson's works it appears in the volume *Memories and Portraits*. Stevenson, as an essayist, wrote Professor Phelps, is 'in the first class; no one would have the temerity to make a collection of representative British essays and omit his work.' Moreover, if we consider his philosophical essays, 'as a philosopher, Stevenson wrote two masterpieces — *Aes Triplex* and *Pulvis et Umbra*. . . .' (*Essays by Robert Louis Stevenson*. Introd. by William Lyon Phelps, New York,1918, pp.x,xi.)

ESSAYS ON LITERATURE

ON SOME TECHNICAL ELEMENTS OF STYLE

This essay was printed in the *Contemporary Review*, April, 1885, and was included in the volumes *Essays and Criticisms*, 1903, and *Essays in the Art of Writing*, 1905. In the collected edition of Stevenson's work, it appears in the volume *Essays on Literature*, etc. Swinnerton, writing of Stevenson's essays, observed: '. . . As a theoretical writer he gives his deliberate example in that one essay *On Some Technical Elements of Style in Literature*; and his theories have aroused bitter comment. Because Stevenson found certain combinations of consonants recurrent in selected passages, it was assumed by critics that he lived in a state of the dreariest kind of pattern-making. That, of course, was a mistake on the part of Stevenson's critics, because Stevenson was a prolific writer, and could never have afforded the time to be a mere hanger-on of words. What Stevenson did was first to realise that a prose style is not the result of accident. He saw that an evil use of adjective and over-emphasis weakened style; and he realised that a solved intricacy of sentence was part of the instinctive cunning by which a good writer lures readers to follow him with ever-growing interest into the most remote passages of his work. He was a deliberate writer, who revised with scrupulous care; and some sentences of Stevenson, meandering most sweetly past their consonants and syllables and "knots," to their destined conclusion, are still, and always will be, a pure delight to the ear. Those who do not take Stevenson's pains will qualify his denunciation of the "natural" writer, because a natural writer is one whose ear is quick and fairly true: he is not necessarily producing "the disjointed babble of the chronicler," but he is incapable of the fine point of exquisite rhythm which we may find in Stevenson's best writing. That writing, various though it is (various, I mean, in "styles"), remains true to its musical principles. It is the result of trained ear and recognition of language as a conscious instrument. It has innumerable, most insidious appeals, to disregard which is a task for the barbarian. It is patterned, it is built of sounds — "one sound suggests, echoes, demands, and harmonises with another" — all in accordance with the expressed theory of Stevenson.' (Frank Swinnerton, *R.L.Stevenson: A Critical Study*, New York,1923, pp.82–83. By permission of the author and of the publishers, Doubleday, Doran and Co.)

WILLIAM MAKEPEACE THACKERAY (1811–63)

CHRONOLOGY

1811 Born July 18, at Calcutta; only child of Richmond and Anne Beecher Thackeray; families on both sides famous in building the Eastern Empire; father died in 1815; Thackeray remained with mother till 1817.

1817–28 Attended school in England, in Hampshire and at Chiswick; disliked schools, fond of drawing; his mother re-married (Major Henry Carmichael-Smyth) and came to England; Thackeray got along well with stepfather; attended Charterhouse School (1822–28).

1829 Entered Trinity College, Cambridge; became friend of FitzGerald, Tennyson, etc.; contributed to college magazines; visited Paris and Weimar (1830); studied law, and made new friends — Maginn, Mill, Kinglake — in England; dropped study of law, for lack of interest; went to Paris the day he came of age.

1833 Made unsuccessful venture in editing the *National Standard*, a literary magazine (1833–34); contributed to *Fraser's*; studied art in Paris (1834); published, with his own illustrations, his first book, *Flore et Zéphyr* (1836);

applied unsuccessfully to illustrate *Pickwick Papers*; back in Paris, worked as a journalist, and married Isabella G.C.Shawe (1836); stepfather failed, and he and Thackeray were burdened ten years by honorably paying all debts.

1837–46 Contributed much to magazines, including *Yellowplush Papers* in *Fraser's* (1837–38); his wife mentally deranged after birth of third daughter; devoted to his family, continued contributing to journals, including *Miss Tickletoby's Lectures on English History*, etc., to *Punch*, and *Barry Lyndon*, to *Fraser's* (1844); began friendship with the Brookfields (1846); wrote *Snobs of England* for *Punch* (1846–47); published his first Christmas book, *Mrs. Perkins' Ball* (1846).

1847 Succeeded greatly with *Vanity Fair* (1847–48); began *Punch's Prize Novelists*, satirical parodies; ill of cholera (1849) — never fully regained health; was lionized in Paris (1850); published *Pendennis* (1850); delivered successful lectures on *The English Humourists*, in England, Scotland, and America (1852–53); published *Henry Esmond* (1852); traveled on the continent; published *The Newcomes* (1855).

1855 Wrote *The Four Georges*, lectures, and gained much profit by delivering them in America (1855–56), England, and Scotland; unsuccessful as candidate for Parliament (1857); traveled on the continent; published *The Virginians* (1859).

1859 Became editor of the *Cornhill Magazine*; contributed to it the *Roundabout Papers* and *Lovel the Widower*; was delighted with the unprecedented success of the magazine — its first issue sold about 120,000 copies instead of the expected 10,000; health increasingly poor; resigned editorship (1862); finished *Philip* (1862); began *Denis Duval* (unfinished).

1863 Died December 24.

COMMENTARY

'Thackeray possessed in a greater measure than any other English writer the *style coulant*, which Baudelaire ascribed in dispraise to George Sand. His words flow like snow-water upon the mountainside. He could no more restrain the current of his prose than a gentle slope could turn a rivulet back upon its course. His sentences dash one over the other in an often aimless succession, as though impelled by a force independent of their author. The style, as employed by Thackeray, has its obvious qualities and defects. It is so easy that it may be followed by the idlest reader, who willingly applies to literature the test of conversation. The thread of argument or of character is so loosely held that it need not elude a half-awakened attention. On the other hand, the style must needs be at times inaccurate and undistinguished. The solecisms of which he is guilty, and they are not few, may readily be forgiven. It is more difficult to pardon the frequent lack of distinction, especially as in *Esmond* Thackeray proved that he could write, if he would, with perfect artistry. But the method of his more familiar books seems the result less of artifice than of temperament. He seldom gives you the impression that he has studied to produce a certain effect. An effect is there, of course, facile and various, but beyond his management. . . .

'From this it follows that he possessed no economy of speech. He never used one word, if a page and a half could adequately express the meaning, and at all save his high moments you miss a controlling hand, a settled purpose. Nor is this remarkable, when you recall the shifts and starts in which he did his work. He was of those who write better anywhere than in their own house. . . .

'While Thackeray left the words to look after themselves, he confesses himself the humble slave of his own characters. . . .

'It was this fatality, this frank obedi-

ence to his own puppets and his own pen, which explains the frequent formlessness of Thackeray's work. But though he permitted most of his books to write themselves, it must not be thought that his style was uniformly hazardous. Despite its occasional inaccuracy, despite its loose texture, it has many shining qualities. It is graphic, various, and at times eloquent. It is easy to recall a hundred passages which would entitle Thackeray to a high place among the writers of English. The Waterloo chapters of *Vanity Fair*, much of *Esmond*, Harry Warrington's first visit to England, Denis Duval's journey to London, — these, to name but a few, are touched by the hand of a master, who need fear comparison with none. Even where Thackeray's prose is least under control, it inspires no more than his own regret that he did not write "a completely good book." For it is always the prose of a man of letters.

'Now, in Thackeray's time scholarship was not fashionable. Neither Dickens nor Bulwer (save in his last novels) gives you a sense of literary allusion. But Thackeray, in his most careless mood, suggests the classics or hints at the eighteenth century. As he wrote rather as an essayist than as a novelist, as his style was a sincere, untrammelled expression of his mind, he reveals his literary preferences by a thousand light touches. His reading, if not wide, was deep. He was perfectly familiar with both the Augustan ages. Horace he knew best of all, and quoted most constantly. Nothing pleases him better than to allude in a phrase to his favourite poet. "Nuper — in former days — I too have militated," thus he writes in *The Roundabout Papers*, "the years slip away fugacius"; and again, "to-morrow the diffugient snows will give place to Spring." Above all, he loved the Augustan doctrine of an easy life. The contemner of Swift naturally found Juvenal a "truculent brute," but he felt a natural sympathy for the satirist of Venusia, who timidly avoided unpleasant themes, and who, had he lived in the nineteenth century, would have been a man about town, and have haunted the very clubs to which Thackeray himself belonged. And when he chose to express himself in verse, he echoed with skill and fidelity both the manner and the philosophy of Horace.

'To our own Augustan age his *Lectures on the Humourists* are an eloquent, if misleading, tribute. He was, after them, the eloquent champion of simplicity. That which he prized most highly in his own work was the rigid exclusion of barbarous or fantastic words, the stern avoidance of involved sentences. And what he avoided himself, he sternly reprobated in others. See how wittily, in his *Essay on Thunder and Small Beer*, he exposes the turgid sentences of *The Times*, with how hot an iron he brands the pompous Latin of the critic. "That is proper economy," says he of the Thunderer's finest sentence, "as you see a buck from Holywell Street put every pinchbeck pin, ring, and chain which he possesses about his shirt, hands, and waistcoat, and then go out and cut a dash in the park, or swagger with his order to the theatre." But Thackeray would have his ornaments few and appropriate. Maybe the Augustan ideal, *simplex munditiis*, impoverished his style; maybe he would have been the greater for a deeper consciousness of himself and his appearance. And though he loyally followed the simplifiers of our English tongue, he knew and admired the better models. If we assume, as we may, that General Lambert, of *The Virginians*, was his mouthpiece, he loved Rabelais and Burton with a constant heart, though he did not admit their influence. Lamb he canonised, and he could quote to excellent purpose Richard Graves' *Spiritual Quixote*, a piece of satire ill deserving the oblivion into which it has fallen. Again, he tells us that Montaigne and Howell's *Letters* were his "bedside books." "If I wake at night," said he, "I have one or other of them to prattle me

to sleep again." But it was not until he attained the serene egoism of *The Roundabout Papers* that either of these writers directed his footsteps, and though they solaced his sleepless nights, by temper and sympathy he remained a true Augustan.'
— Charles Whibley, *William Makepeace Thackeray*, New York,1903, pp.234–39.

NOTES

THE FOUR GEORGES

During the summer of 1855 Thackeray was busy writing a series of four lectures, on the four Georges, to be delivered to American audiences on a second lecture tour of America. From October, 1855, to April, 1856, he made a highly successful and profitable tour with these lectures. In the following winter and spring he toured England and Scotland with them. They were first published in the *Cornhill Magazine*, July, August, September, and October, 1860; they appeared in book form in November in New York, and the following year in London.

The American biographer and literary historian, George Ticknor, in a letter from Boston, Dec. 23, 1855, wrote to Sir Edmund Head: '. . . I have heard Thackeray's four lectures on the four Georges, truculent enough in their general satire, — though not much beyond the last half-volume of "Harry Esmond" about Queen Anne, — but full of generous passages about individuals. The sketches of the German princes of the seventeenth century, and down to the middle of the eighteenth, with which he opened, amused me more than anything else. They were capital. The passage most applauded was a beautiful tribute of loyalty to Queen Victoria, and the tone and manners of her Court. It was given, on his part, with much feeling, and brought down the house — always crowded — very fervently. . . . His audience was the best the city could give, and above twelve hundred strong, besides which, he repeated the lecture about George III. to an audience of two thousand, two or three evenings ago.' (George Ticknor, *Life, Letters, and Journals*, Boston, 1876, II,293–94.)

Many charges of disloyalty were made against Thackeray because of the outspoken frankness of these lectures. Thackeray, proud of his 'loyalty' and 'honest English feeling,' resented such charges. And Elizabeth Barrett Browning wrote to Mrs. Jameson: 'I heard one of Thackeray's lectures, the one on George the Third, and thought it better than good — fine and touching. To what is it that people are objecting? At any rate, they crowd and pay' (*Letters*, ed. Kenyon, 4th ed., 1898, II, 253). The American historian John Lothrop Motley wrote, in May, 1858, that he had heard Thackeray read one of his lectures before a private audience: 'It was on George III. — one of the set of the four Georges, first delivered in America, and which have often been read in England, but have never been printed. I was much impressed with the quiet, graceful ease with which he read — just a few notes above the conversational level — but never rising into the declamatory. This light-in-hand manner suits well the delicate, hovering rather than superficial style of the composition. He skims lightly over the surface of the long epoch, throwing out a sketch here, exhibiting a characteristic trait there, and sprinkling about a few anecdotes, portraits, and historical allusions, running along from grave to gay, from lively to severe, moving and mocking the sensibilities in a breath, in a way which I should say was the perfection of lecturing to high-bred audiences. I suppose his manner, and his stuff also, are somewhat stronger for larger and more heterogeneous assemblies, for I have no doubt he left out a good deal which might jar upon the ears polite of his audience upon this occasion. Still, I was somewhat surprised at the coolness with which he showed up the foibles and absurdities of kings, and court, and court folks in a former but not remote reign, before a small

company, which consisted of the cream of London cream. They seemed to enjoy it, and to laugh heartily at all the points without wincing. If he had shown up Democracy or Southern chivalry thus before an assemblage of the free and enlightened, he would have been tarred and feathered on the spot.' (*Correspondence*, ed. G.W.Curtis, 1889, I,241.)

ROUNDABOUT PAPERS

To the *Cornhill Magazine*, of which Thackeray was the first editor, he contributed a series of familiar essays, called 'Roundabout Papers,' commencing with the first number, January, 1860. 'Thorns in the Cushion' was printed in the July number; 'On Being Found Out,' in the number of May, 1861. The volume *Roundabout Papers*, reprinting the *Cornhill* essays, appeared in 1863. Bliss Perry observed, in a brief tracing of Thackeray's career, that 'last of all, the necessity of writing a monthly essay during his editorship of "The Cornhill Magazine" produced the "Roundabout Papers," where surely there is fun enough and truth enough, but where the spirit of love is nevertheless supreme. The "Roundabout Papers" are discursive, reminiscent, inimitable talk, enriched by a life-time's commerce with what is best in books and in society, touched now and then by a natural melancholy, yet uttered with all the old grace and with a new gentleness. To compare them with "The Yellowplush Papers" or "The Book of Snobs" is to observe the ripening of a character as well as the maturing of a mind.' (*Thackeray*, p.viii, from *The Pocket University*, Vol.I, copyright 1898, 1926, by Doubleday, Doran.) According to Whibley, the *Roundabout Papers* 'show the best side of Thackeray, and suggest, that though Thackeray could not refrain from essay-writing even in his novels, how brilliant an essayist was lost in the author of *Vanity Fair*.' (Charles Whibley, *William Makepeace Thackeray*, New York,1903, p.232.) Malcolm Elwin wrote that for Thackeray 'the period of inspired parturition as a novelist closed with *The Newcomes*; the *Cornhill* opened a new field for his genius by offering an opportunity for the *Roundabout Papers*, which comprise his claim to consideration as the greatest exponent of the *causerie* essay since Elia.' (*Thackeray: A Personality*[1932], p.355.)

Appendix

Passages Illustrative of Nineteenth-Century Conceptions of Growth, Development, Evolution

[LYELL ON GEOLOGICAL CHANGE]

Modern Progress of Geology

No period could have been more fortunate for the discovery, in the immediate neighbourhood of Paris, of a rich store of well-preserved fossils, than the commencement of the present century; for at no former era had Natural History been cultivated with such enthusiasm in the French metropolis. The labours of Cuvier in comparative osteology, and of Lamarck in recent and fossil shells, had raised these departments of study to a rank of which they had never previously been deemed susceptible. Their investigations had eventually a powerful effect in dispelling the illusion which had long prevailed concerning the absence of analogy between the ancient and modern state of our planet. A close comparison of the recent and fossil species, and the inferences drawn in regard to their habits, accustomed the geologist to contemplate the earth as having been at successive periods the dwelling-place of animals and plants of different races, some terrestrial, and others aquatic — some fitted to live in seas, others in the waters of lakes and rivers. By the consideration of these topics, the mind was slowly and insensibly withdrawn from imaginary pictures of catastrophes and chaotic confusion, such as haunted the imagination of the early cosmogonists. Numerous proofs were discovered of the tranquil deposition of sedimentary matter, and the slow development of organic life. If many writers, and Cuvier himself in the number, still continued to maintain, that 'the thread of induction was broken,'[1] yet, in reasoning by the strict rules of induction from recent to fossil species, they in a great measure disclaimed the dogma which in theory they professed. The adoption of the same generic, and, in some cases, even of the same specific, names for the exuviae of fossil animals and their living analogues, was an important step towards familiarising the mind with the idea of the identity and unity of the system in distant eras. It was an acknowledgment, as it were, that part at least of the ancient memorials of nature were written in a living language. The growing importance, then, of the natural history of organic remains may be pointed out as the characteristic feature of the progress of the science during the present century. This branch of knowledge has already become an instrument of great utility in geological classification, and is continuing daily to unfold new data for grand and enlarged views respecting the former changes of the earth.

When we compare the result of observations in the last thirty years with those of the three preceding centuries, we cannot but look forward with the most sanguine expectations to the degree of excellence to which geology may be carried, even by the labours of the present generation. Never, perhaps, did any science, with the exception of astronomy, unfold, in an equally brief period, so many novel and unexpected truths, and overturn so many preconceived opinions. The senses had for ages declared the earth to be at rest, until the astronomer taught that it was carried through space with inconceivable rapidity. In like manner was the surface of this planet regarded as having remained unaltered since its creation, until the geolo-

1. Discours sur les Révol. &c.

gist proved that it had been the theatre of reiterated change, and was still the subject of slow but never-ending fluctuations. The discovery of other systems in the boundless regions of space was the triumph of astronomy: to trace the same system through various transformations — to behold it at successive eras adorned with different hills and valleys, lakes and seas, and peopled with new inhabitants, was the delightful meed of geological research. By the geometer were measured the regions of space, and the relative distances of the heavenly bodies; — by the geologist myriads of ages were reckoned, not by arithmetical computation, but by a train of physical events — a succession of phenomena in the animate and inanimate worlds — signs which convey to our minds more definite ideas than figures can do of the immensity of time.

Whether our investigation of the earth's history and structure will eventually be productive of as great practical benefits to mankind as a knowledge of the distant heavens, must remain for the decision of posterity. It was not till astronomy had been enriched by the observations of many centuries, and had made its way against popular prejudices to the establishment of a sound theory, that its application to the useful arts was most conspicuous. The cultivation of geology began at a later period; and in every step which it has hitherto made towards sound theoretical principles, it has had to contend against more violent prepossessions. The practical advantages already derived from it have not been inconsiderable: but our generalisations are yet imperfect, and they who come after us may be expected to reap the most valuable fruits of our labour. Meanwhile the charm of first discovery is our own; and, as we explore this magnificent field of inquiry, the sentiment of a great historian of our times may continually be present to our minds, that 'he who calls what has vanished back again into being, enjoys a bliss like that of creating.'[2]

Introduction of man, to what extent a change in the system. — But setting aside the question of progressive development, another and a far more difficult one may arise out of the admission that man is comparatively of modern origin. Is not the interference of the human species, it may be asked, such a deviation from the antecedent course of physical events, that the knowledge of such a fact tends to destroy all our confidence in the uniformity of the order of nature, both in regard to time past and future? If such an innovation could take place after the earth had been exclusively inhabited for thousands of ages by inferior animals, why should not other changes as extraordinary and unprecedented happen from time to time? If one new cause was permitted to supervene, differing in kind and energy from any before in operation, why may not others have come into action at different epochs? Or what security have we that they may not arise hereafter? And if such be the case, how can the experience of one period, even though we are acquainted with all the possible effects of the then existing causes, be a standard to which we can refer all natural phenomena of other periods?

Now these objections would be unanswerable, if adduced against one who was contending for the absolute uniformity throughout all time of the succession of sublunary events — if, for example, he was disposed to indulge in the philosophical reveries of some Egyptian and Greek sects, who represented all the changes both of the moral and material world as repeated at distant intervals, so as to follow each other in their former connexion of place and time. For they compared the course of events on our globe to astronomical cycles; and not only did they consider all sublunary affairs to be under the influence of the celestial bodies, but they taught that

2. Niebuhr's Hist. of Rome, vol i. p.5. Hare and Thirlwall's translation.

on the earth, as well as in the heavens, the same identical phenomena recurred again and again in a perpetual vicissitude. The same individual men were doomed to be re-born, and to perform the same actions as before; the same arts were to be invented, and the same cities built and destroyed. The Argonautic expedition was destined to sail again with the same heroes, and Achilles with his Myrmidons to renew the combat before the walls of Troy.

Alter erit tum Tiphys, et altera quae vehat Argo
Dilectos heroas: erunt etiam altera bella,
Atque iterum ad Trojam magnus mittetur Achilles.[3]

The geologist, however, may condemn these tenets as absurd, without running into the opposite extreme, and denying that the order of nature has, from the earliest periods, been uniform in the same sense in which we believe it to be uniform at present, and expect it to remain so in future. We have no reason to suppose, that when man first became master of a small part of the globe, a greater change took place in its physical condition than is now experienced when districts, never before inhabited, became successively occupied by new settlers. When a powerful European colony lands on the shores of Australia, and introduces at once those arts which it has required many centuries to mature; when it imports a multitude of plants and large animals from the opposite extremity of the earth, and begins rapidly to extirpate many of the indigenous species, a mightier revolution is effected in a brief period than the first entrance of a savage horde, or their continued occupation of the country for many centuries, can possibly be imagined to have produced. If there be no impropriety in assuming that the system is uniform when disturbances so unprecedented occur in certain localities, we can with much greater confidence apply the same language to those primeval ages when the aggregate number and power of the human race, or the rate of their advancement in civilisation, must be supposed to have been far inferior. In reasoning on the state of the globe immediately before our species was called into existence, we must be guided by the same rules of induction as when we speculate on the state of America in the interval that elapsed between the introduction of man into Asia, the supposed cradle of our race, and the arrival of the first adventurers on the shores of the New World. In that interval, we imagine the state of things to have gone on according to the order now observed in regions unoccupied by man. Even now, the waters of lakes, seas, and the great ocean, which teem with life, may be said to have no immediate relation to the human race — to be portions of the terrestrial system of which man has never taken, nor ever can take, possession; so that the greater part of the inhabited surface of the planet may remain still as insensible to our presence as before any isle or continent was appointed to be our residence.

If the barren soil around Sydney had at once become fertile upon the landing of our first settlers; if, like the happy isles whereof the poets have given us such glowing descriptions, those sandy tracts had begun to yield spontaneously an annual supply of grain, we might then, indeed, have fancied alterations still more remarkable in the economy of nature to have attended the first coming of our species into the planet. Or if, when a volcanic island like Ischia was, for the first time, brought under cultivation by the enterprise and industry of a Greek colony, the internal fire had become dormant, and the earthquake had remitted its destructive violence, there would then have been some ground for speculating on the debilitation

3. Virgil, Eclog.iv. For an account of these doctrines, see Dugald Stewart's Elements of the Philosophy of the Human Mind, vol.ii. chap.ii sect.4., and Prichard's Egypt.Mythol. p.177.

of the subterranean forces, when the earth was first placed under the dominion of man. But after a long interval of rest, the volcano bursts forth again with renewed energy, annihilates one half of the inhabitants, and compels the remainder to emigrate. The course of nature remains evidently unchanged; and, in like manner, we may suppose the general condition of the globe, immediately before and after the period when our species first began to exist, to have been the same, with the exception only of man's presence.

The modifications in the system of which man is the instrument, do not, perhaps, constitute so great a deviation from previous analogy as we usually imagine; we often, for example, form an exaggerated estimate of the extent of our power in extirpating some of the inferior animals, and causing others to multiply; a power which is circumscribed within certain limits, and which, in all likelihood, is by no means exclusively exerted by our species.[4] The growth of human population cannot take place without diminishing the numbers, or causing the entire destruction, of many animals. The larger carnivorous species give way before us, but other quadrupeds of smaller size, and innumerable birds, insects, and plants, which are inimical to our interests, increase in spite of us, some attacking our food, others our raiment and persons, and others interfering with our agricultural and horticultural labours. We behold the rich harvest which we have raised with the sweat of our brow devoured by myriads of insects, and are often as incapable of arresting their depredations, as of staying the shock of an earthquake, or the course of a stream of lava.

A great philosopher has observed, that we can command nature only by obeying her laws; and this principle is true even in regard to the astonishing changes which are superinduced in the qualities of certain animals and plants by domestication and garden culture. I shall point out in the third book that we can only effect such surprising alterations by assisting the development of certain instincts, or by availing ourselves of that mysterious law of their organisation, by which individual peculiarities are transmissible from one generation to another.[5]

It is probable from these, and many other considerations, that as we enlarge our knowledge of the system, we shall become more and more convinced, that alterations caused by the interference of man deviate far less from the analogy of those effected by other animals than is usually supposed.[6] We are often misled, when we institute such comparisons, by our knowledge of the wide distinction between the instincts of animals and reasoning power of man; and we are apt hastily to infer, that the effects of a rational and an irrational species, considered merely *as physical agents*, will differ almost as much as the faculties by which their actions are directed.

It is not, however, intended that a real departure from the antecedent course of physical events cannot be traced in the introduction of man. If that latitude of action which enables the brutes to accommodate themselves in some measure to accidental circumstances, could be imagined to have been at any former period so great, that the operations of instinct were as much diversified as are those of human reason, it might, perhaps, be contended, that the agency of man did not constitute an anomalous deviation from the previously established order of things. It might then have been said, that the earth's becoming at a particular period the residence of human beings, was an era in the moral, not in the physical world — that our study and contemplation of the earth, and the laws which govern its animate productions, ought no more to be

4. See Book iii. ch.ix.

5. See Book iii. ch.iii.

6. Id. chapters v vi.vii. and ix.

considered in the light of a disturbance or deviation from the system, than the discovery of the satellites of Jupiter should be regarded as a physical event affecting those heavenly bodies. Their influence in advancing the progress of science among men, and in aiding navigation and commerce, was accompanied by no reciprocal action of the human mind upon the economy of nature in those distant planets; and so the earth might be conceived to have become, at a certain period, a place of moral discipline, and intellectual improvement to man, without the slightest derangement of a previously existing order of change in its animate and inanimate productions.

The distinctness, however, of the human from all other species, considered merely as an efficient cause in the physical world, is real; for we stand in a relation to contemporary species of animals and plants widely different from that which other irrational animals can ever be supposed to have held to each other. We modify their instincts, relative numbers, and geographical distributions in a manner superior in degree, and in some respects very different in kind, from that in which any other species can affect the rest. Besides, the progressive movement of each successive generation of men causes the human species to differ more from itself in power at two distant periods, than any one species of the higher order of animals differs from another. The establishment, therefore, by geological evidence, of the first intervention of such a peculiar and unprecedented agency, long after other parts of the animate and inanimate world existed, affords ground for concluding that the experience during thousands of ages of all the events which may happen on this globe would not enable a philosopher to speculate with confidence concerning future contingencies.

If then an intelligent being, after observing the order of events for an indefinite series of ages, had witnessed at last so wonderful an innovation as this, to what extent would his belief in the regularity of the system be weakened? — would he cease to assume that there was permanency in the laws of nature? — would he no longer be guided in his speculations by the strictest rules of induction? To these questions it may be answered, that, had he previously presumed to dogmatize respecting the absolute uniformity of the order of nature, he would undoubtedly be checked by witnessing this new and unexpected event, and would form a more just estimate of the limited range of his knowledge, and the unbounded extent of the scheme of the universe. But he would soon perceive that no one of the fixed and constant laws of the animate or inanimate world was subverted by human agency, and that the modifications produced were on the occurrence of new and extraordinary circumstances, and those not of a physical but a moral nature. The deviation permitted would also appear to be as slight as was consistent with the accomplishment of the new moral end proposed, and to be in a great degree temporary in its nature, so that, whenever the power of the new agent was withheld, even for a brief period, a relapse would take place to the ancient state of things; the domesticated animal, for example, recovering in a few generations its wild instinct, and the garden-flower and fruit-tree reverting to the likeness of the parent stock.

Now, if it would be reasonable to draw such inferences with respect to the future, we cannot but apply the same rules of induction to the past. We have no right to anticipate any modifications in the results of existing causes in time to come, which are not conformable to analogy, unless they be produced by the progressive development of human power, or perhaps by some other new relations which may hereafter spring up between the moral and material worlds. In the same manner, when we speculate on the vicissitudes of the animate and inanimate creation in for-

mer ages, we ought not to look for any anomalous results, unless where man has interfered, or unless clear indications appear of some other moral source of temporary derangement.

For the discussion of other popular objections advanced against the doctrine of the identity of the ancient and modern causes of change, especially those founded on the supposed suddenness of general catastrophes, and the transition from one set of organic remains to another, I must refer to the 4th Book. In the mean time, when difficulties arise in interpreting the monuments of the past, I deem it more consistent with philosophical caution to refer them to our present ignorance of all the existing agents, or all their possible effects in an indefinite lapse of time, than to causes formerly in operation, but which have ceased to act; and if in any part of the globe the energy of a cause appears to have decreased, I consider it more probable that the diminution of intensity in its action is merely local, than that its force is impaired throughout the whole globe. But should there appear reason to believe that certain agents have, at particular periods of past time, been more potent instruments of change over the entire surface of the earth than they now are, it is still more consistent with analogy to presume, that after an interval of quiescence they will recover their pristine vigour, than to imagine that they are worn out.

The geologist who assents to the truth of these principles will deem it incumbent on him to examine with minute attention all the changes now in progress on the earth, and will regard every fact collected respecting the causes in diurnal action, as affording him a key to the interpretation of some mystery in the archives of remote ages. His estimate of the value of geological evidence, and his interest in the investigation of the earth's history, will depend entirely on the degree of confidence which he feels in regard to the permanency of the great causes of change. Their constancy alone will enable him to reason from analogy, and to arrive, by a comparison of the state of things at distinct epochs, at the knowledge of the general laws which govern the economy of our system.

The uniformity of the plan being once assumed, events which have occurred at the most distant periods in the animate and inanimate world will be acknowledged to throw light on each other, and the deficiency of our information respecting some of the most obscure parts of the present creation will be removed. For as, by studying the external configuration of the existing land and its inhabitants, we may restore in imagination the appearance of the ancient continents which have passed away, so may we obtain from the deposits of ancient seas and lakes an insight into the nature of the subaqueous processes now in operation, and of many forms of organic life, which, though now existing, are veiled from sight. Rocks, also, produced by subterranean fire in former ages at great depths in the bowels of the earth, present us, when upraised by gradual movements, and exposed to the light of heaven, with an image of those changes which the deep seated volcano may now occasion in the nether regions. Thus, although we are mere sojourners on the surface of the planet, chained to a mere point in space, enduring but for a moment of time, the human mind is not only enabled to number worlds beyond the unassisted ken of mortal eye, but to trace the events of indefinite ages before the creation of our race, and is not even withheld from penetrating into the dark secrets of the ocean, or the interior of the solid globe; free, like the spirit which the poet described as animating the universe,

— ire per omnes
Terrasque, tractusque maris, coelumque profundum.

Chapter XXIV

Analogy of the Older Fossiliferous to the Tertiary Strata

That land as well as sea existed at each successive period — Some former continents placed where it is now sea — Secondary freshwater deposits, why rare (p. 313.) — Persistency of mineral composition, why apparently greatest in older rocks — Supposed universality of red marl formation — Secondary rocks, why more consolidated — why more fractured and disturbed (p.318.) — Secondary volcanic rocks of many different ages.

In the last chapter I stated that no detailed account of the older fossiliferous formations would be attempted in this work, and that I should confine myself almost exclusively to the inquiry how far the rules of interpretation previously adopted for the tertiary groups might be applied to the phenomena of more ancient strata. To this point the following remarks are chiefly directed: —

Position of former continents. — The existence of land as well as sea, at every geological period, is attested by the remains of terrestrial plants imbedded in the deposits of all ages, even the most remote. We find fluviatile shells not unfrequently in the secondary strata, and here and there some freshwater formations; but the latter are less common than in the tertiary series. For this fact the reader's mind has been prepared, by the views advanced in the third chapter respecting the different circumstances under which the secondary and tertiary strata appear to have originated. The secondary, it was suggested, may have been accumulated in an ocean like the Pacific, where coralline and shelly limestones are forming; or in a basin like the bed of the western Atlantic, which may have received, for ages, the turbid waters of great rivers, such as the Amazon and Orinoco, each draining a considerable extent of continent. The *tertiary* deposits, on the other hand, very probably accumulated during the growth of a continent, by successive emergence of new lands, and the uniting together of islands. During such changes, inland seas and lakes would be caused, and their basins afterwards filled up with sediment, and then raised above the level of the waters.

That the greater part of the space now occupied by the European continent was sea when some of the secondary rocks were produced, must be inferred from the wide areas over which several of the marine groups are diffused; but we need not suppose that the quantity of land was less in those remote ages, but merely that its position was very different.

It has been shown that, immediately below the chalk and green-sand, a fluviatile formation, called the Wealden, occurs, which has been ascertained to extend from west to east about 200 English miles, and from northwest to southeast about 220 miles, the depth or total thickness of the beds, where greatest, being about 2000 feet.[7] These phenomena clearly indicate that there was a constant supply in that region, for a long period, of a considerable body of fresh water, such as might be supposed to have drained a continent, or a large island, containing within it a lofty chain of mountains. Dr. Fitton, in speaking of these appearances, recalls to our recollection that the delta of the newly discovered Quorra, or Niger, in Africa, stretches into the interior for more than 170 miles, and occupies, it is supposed, a space of more than 300 miles along the coast; thus forming a surface of more than 25,000 square miles, or equal to about one half of England.[8]

If asked where the continent was placed from the ruins of which the Wealden strata were derived, we might be almost tempted to speculate on the former existence of the Atlantis of Plato as true in geology, although fabulous as an historical event.

7. Fitton's Geology of Hastings, p.58.
8. Fitton, Geol. of Hastings, p.58, who cites Lander's Travels.

We know that the present European lands have come into existence almost entirely since the deposition of the chalk (see map, Plate II.); and the same period may have sufficed for the disappearance of a continent of equal magnitude, situated farther to the west.

But among the numerous fossils of the ancient delta of the Wealden no remains of mammalia have been detected; whereas we should naturally expect, on examining the deposits recently formed at the mouths of the Quorra, Indus, or Ganges, to find, not only the bones of birds and of amphibious and land reptiles, but also those of the hippopotamus, and other mammalia which frequent the banks of rivers. Mr. Mantell seems to have demonstrated,[9] that the remains of the animals and plants found fossil in the Wealden have, with the exception of the testacea and other aquatic tribes, been transported for a considerable distance, the stems of the plants being, for the most part, torn and intermingled with pebbles of quartz, slate, and jasper; while the bones of lizards, turtles, and fish, are detached from the skeleton, and more or less broken and rolled. But, admitting that these fossils were drifted for many a league, we might fairly expect that, at least, some fragments of mammiferous bones would have reached the delta.

It is certainly a startling proposition to suppose, that a continent covered with vegetation, which had its forests of palms and tree-ferns, and its plants allied to the Dracaena and Cycas, which was inhabited by large saurians, and by birds, was, nevertheless, entirely devoid of land quadrupeds. If the proofs were confined to the Wealden, we might hesitate to lay much stress on mere negative evidence, since extensive deposits of the Eocene period, such as the London clay, have as yet yielded no mammiferous fossils. But when we find the same general absence of mammalia in strata of the Oolitic and Liassic areas, we can hardly refuse to admit that the highest order of quadrupeds was very feebly represented in those ages, when the small Didelphys of Stonesfield was entombed. Some of the bones, indeed, collected by Dr. Buckland from the oolitic series, have been pronounced by Cuvier to be cetaceous; but that naturalist has himself remarked how closely the vertebrae of the larger reptiles resemble those of certain dolphins; so that it is highly desirable that the fossils alluded to should be reexamined with great care.[10]

So far, then, as our present inquiries enable us to judge, there are strong indications that, during the periods of the Wealden, the Oolite, and Lias, there was a large development of the reptilia, at the expense, as it were, both of the cetaceous and terrestrial mammalia.

It may be well, then, to inquire whether this difference in the state of animal life in the northern hemisphere, at these remote periods, is irreconcilable with the notion of the constancy and uniformity of the laws which govern the changes of the organic world. Would the almost entire suppression of one important class of vertebrated animals, and the larger development of another, if fully established on farther investigation, imply that there are no fixed rules according to which the form, structure, and attributes of animals are accommodated to the endless vicissitudes of the earth's surface? Or are the rules, if any, made to endure for a time only, new ones being substituted at each successive period? Or, is it conceivable that the distinct zoological characters of certain secondary groups, as compared to others of the tertiary epoch, may depend on laws as uniform as those which, from one century to another, appear to determine the growth of certain tribes of plants and animals in the arctic, and of others in tropical regions?

In Australia, New Zealand, and many other parts of the southern hemisphere,

9. Geol. of S.E. of England, p.232.

10. Mantell, Geol. of S.E. England, p.282.; and see above, Vol.I. p.232.

where the indigenous land quadrupeds are comparatively few and of small dimensions, the reptiles do not predominate in number or size. The deposits formed at the mouth of an Australian river, within the tropics, might contain the bones of only a few small marsupial animals, which, like those of Stonesfield, might hereafter be discovered with difficulty by geologists; but there would, at the same time, be no megalosauri and other fossil remains, showing that large saurians were plentiful on the land and in the waters when mammalia were scarce.

No precise analogy, therefore, can here be found to the state of the animal kingdom supposed to have prevailed during the secondary periods when a high temperature pervaded European latitudes. But it may be useful to consider whether any of the anomalies now caused by climate in the relative number and importance of different classes of the vertebrata may not in some degree illustrate this topic. In the Arctic regions, for example, reptiles are small, and sometimes wholly wanting, where birds, large land quadrupeds, and cetacea abound. We meet with bears, wolves, foxes, musk oxen, and deer, walruses, seals, whales, and narwals, in regions of ice and snow, where the smallest snakes, efts, and frogs are rarely if ever seen.

On what grand laws in the animal physiology this remarkable phenomenon depends, cannot, in the present state of science, be explained; nor could we predict whether any apposite condition of the atmosphere in respect to heat, moisture, and other circumstances, would bring about a state of animal life which might be called the converse of that above described; a state of things in which large mammalia might abound, and reptiles disappear. We ought, however, to recollect, that a mean annual temperature like that now experienced at the equator, co-existing with the unequal days and nights of European latitudes, and with a distinct distribution of sea and land, would imply a climate to which we have now no parallel. Consequently, the type of animal and vegetable existence required for such a climate might deviate as widely from that now established in any part of the globe, as do the Flora and Fauna of our tropical differ from those of our arctic regions.

Concluding Remarks

In the history of the progress of geology, it has been stated that the opinion originally promulgated by Hutton, 'that the strata called *primitive* were mere altered sedimentary rocks,' was vehemently opposed for a time, on the ground of its supposed tendency to promote a belief in the past eternity of our planet.[11] Before that period the absence of animal and vegetable remains in the so-called primitive strata had been appealed to, as proving that there had been an era when the planet was uninhabited by living beings, and when, as was also inferred, it was uninhabitable, and, therefore, probably in a nascent state.

The opposite doctrine, that the oldest visible strata might be the monuments of an antecedent period, when the animate world was already in existence, was declared to be equivalent to the assumption that there never was a beginning to the present order of things. The unfairness of this charge was clearly pointed out by Playfair, who observed, 'that it was one thing to declare that we had not yet discovered the traces of a beginning, and another to deny that the earth ever had a beginning.'

I regret, however, to find that the bearing of my arguments in the first book has been misunderstood in a similar manner; for I have been charged with endeavouring to establish the proposition, that 'the existing causes of change have operated with absolute uniformity from all eternity.'[12]

11. Vol.I. p.92.
12. Quarterly Review, No.86., Oct.1830, p.464.

It is the more necessary to notice this misrepresentation of my views, as it has proceeded from a friendly critic, whose theoretical opinions coincide in general with my own; but who has, in this instance, strangely misconceived the scope of the argument. With equal justice might an astronomer be accused of asserting that the works of creation extended throughout *infinite* space, because he refuses to take for granted that the remotest stars now seen in the heavens are on the utmost verge of the material universe. Every improvement of the telescope has brought thousands of new worlds into view; and it would, therefore, be rash and unphilosophical to imagine that we already survey the whole extent of the vast scheme, or that it will ever be brought within the sphere of human observation.

But no argument can be drawn from such premises in favour of the infinity of the space that has been filled with worlds; and if the material universe has any limits, it then follows that it must occupy a minute and infinitesimal point in infinite space.

So if, in tracing back the earth's history, we arrive at the monuments of events which may have happened millions of ages before our times, and if we still find no decided evidence of a commencement, yet the arguments from analogy in support of the probability of a beginning remain unshaken; and if the past duration of the earth be finite, then the aggregate of geological epochs, however numerous, must constitute a mere moment of the past, a mere infinitesimal portion of eternity.

It has been argued, that, as the different states of the earth's surface, and the different species by which it has been inhabited, have all had their origin, and many of them their termination, so the entire series may have commenced at a certain period. It has also been urged, that, as we admit the creation of man to have occurred at a comparatively modern epoch — as we concede the astonishing fact of the first introduction of a moral and intellectual being — so also we may conceive the first creation of the planet itself.

I am far from denying the weight of this reasoning from analogy; but, although it may strengthen our conviction, that the present system of change has not gone on from eternity, it cannot warrant us in presuming that we shall be permitted to behold the signs of the earth's origin, or the evidences of the first introduction into it of organic beings. We aspire in vain to assign limits to the works of creation in *space*, whether we examine the starry heavens, or that world of minute animalcules which is revealed to us by the microscope. We are prepared, therefore, to find that in *time* also the confines of the universe lie beyond the reach of mortal ken. But in whatever direction we pursue our researches, whether in time or space, we discover everywhere the clear proofs of a Creative Intelligence, and of His foresight, wisdom, and power.

As geologists, we learn that it is not only the present condition of the globe which has been suited to the accommodation of myriads of living creatures, but that many former states also have been adapted to the organisation and habits of prior races of beings. The disposition of the seas, continents, and islands, and the climates, have varied; the species likewise have been changed; and yet they have all been so modelled, on types analogous to those of existing plants and animals, as to indicate throughout a perfect harmony of design and unity of purpose. To assume that the evidence of the beginning or end of so vast a scheme lies within the reach of our philosophical inquiries, or even of our speculations, appears to be inconsistent with a just estimate of the relations which subsist between the finite powers of man and the attributes of an Infinite and Eternal Being.

— Sir Charles Lyell,
Principles of Geology
(1830–33).

[CHAMBERS ON NATURAL CREATION THROUGH ORGANIC DEVELOPMENT]

General Considerations Respecting the Origin of the Animated Tribes

Thus concludes the wondrous chapter of the earth's history which is told by geology. It takes up our globe at the period when its original incandescent state had nearly ceased; conducts it through what we have every reason to believe were vast, or at least very considerable, spaces of time, in the course of which many superficial changes took place, and vegetable and animal life was gradually devolved; and drops it just at the point when man was apparently about to enter on the scene. The compilation of such a history, from materials of so extraordinary a character, and the powerful nature of the evidence which these materials afford, are calculated to excite our admiration, and the result must be allowed to exalt the dignity of science, as a product of man's industry and his reason.

If there is anything more than another impressed on our minds by the course of the geological history, it is, that the same laws and conditions of nature now apparent to us have existed throughout the whole time, though the operation of some of these laws may now be less conspicuous than in the early ages, from some of the conditions having come to a settlement and a close. That seas have flowed and ebbed, and winds disturbed their surfaces, in the time of the secondary rocks, we have proof on the yet preserved surfaces of the sands which constituted margins of the seas in those days. Even the fall of wind-slanted rain is evidenced on the same tablets. The washing down of detached matter from elevated grounds, which we see rivers constantly engaged in at the present time, and which is daily shallowing the seas adjacent to their mouths, only preceded on a greater scale in earlier epochs. The volcanic subterranean force, which we see belching forth lavas on the sides of mountains, and throwing up new elevations by land and sea, was only more powerfully operative in distant ages. To turn to organic nature, vegetation proceeded then exactly as now. The very alternation of the seasons has been read in unmistakable characters in sections of the trees of those days, precisely as it might be read in a section of a tree cut down yesterday. The system of prey amongst animals flourished throughout the whole of the pre-human period; and the adaptation of all plants and animals to their respective spheres of existence was as perfect in those early ages as it is still.

But, as has been observed, the natural laws, though essentially unchanging, may operate with greater force at one time than at another, and may be modified by attendant conditions. In the carbonigenous era, dry land seems to have consisted only of clusters of islands, and the temperature was much above what now prevails at the same places. Volcanic forces, and perhaps also the disintegrating power, have been on the decrease since the first, or we have at least long enjoyed an exemption from such paroxysms of the former, as for certain prevailed at the close of the coal formation in England and throughout the tertiary era. The surface has also undergone a gradual progress by which it has become always more and more variegated, and thereby fitted for the residence of a higher class of animals.

In pursuing the progress of the development of both plants and animals upon the globe, we have seen an advance in both cases, from simple to higher forms of organisation. In the botanical department, we have first sea, afterwards land plants; and amongst these, the simpler (cellular

and cryptogamic) before the more complex. In the department of zoology, we see, first, traces all but certain of infusoria; then polypiaria, crinoidea, and some of the articulata and mollusca; afterwards higher forms of the most of these humble classes of animals; and it appears that such existed for ages before there were any higher types of being. The first step forward gives fishes, the humblest class of the vertebrata; and these are of the cartilaginous orders, and marked by several other traits of inferior organisation.

Afterwards come land animals, of which the first are reptiles, universally allowed to be the type next in advance from fishes, and to be connected with these by the links of an insensible gradation. From reptiles we advance to birds, and then to mammalia, the first of which are marsupialia, acknowledgedly low forms in their class. That there is thus a progress of some kind, the most superficial glance at the geological history is sufficient to convince us. Indeed, the doctrine of the gradation of animal forms has received a remarkable support from the discoveries of this science, as several types formerly wanting to a completion of the series have been found in a fossil state.[1]

Fossil history has no doubt some obscure and difficult passages, but they are not more than might be expected, when we consider certain obvious circumstances attending, first, the inhumation, and afterwards the discovery or investigation of fossils. These are unquestionably of a nature to forbid completeness and regularity in the details of the fossil history, though not to affect the great leading facts. For example, some animal and vegetable forms are of too slight a structure to admit of their being preserved in rocks, especially those of an early kind, which have almost all been greatly altered by exposure to heat. It is also certain that in the primeval, as in the present seas, various animals affected various localities, according to peculiarities of depth, temperature, and opportunities of feeding; so that no particular group found as fossils in one geographical space can be received as a perfect sample of the whole animal kingdom as then existing. We are also, it must be observed, in the infancy of geological research; every year is bringing us new light respecting the details of fossil history from various regions of the globe. Then, we are but doubtfully informed on the affinities and comparative organisation of animals: beyond the general facts with regard to sub-kingdoms and classes, zoological science does not at present speak conclusively on the subject of gradation. All these things being considered, we are not entitled, upon any blanks or confusions which may at present appear in these details, to ground decisive objections to that idea of progress in animated nature which palaeontology in the main so plainly teaches. Thus, for the facts — if they be such — that we have at first no traces of plants simpler than fuci, or animals below the polypiaria and crinoidea, it may be said in explanation that such organic forms, supposing they had existed in the greatest profusion, had hardly any chance of leaving memorials of their substance in the metamorphic rocks. When we find, in the English protozoic rocks, highly organized carnivorous mollusks side by side with lower orders of invertebrata we may point to America, where the protozoic rocks present no such exalted forms and ask if the very earliest fossiliferous rocks, the true protozoic formation, have as yet been anywhere found. Finally, with respect to a reptilian dentition appearing at an early period among fishes, — lacterine reptiles with no apparent affinity to these being the first fossils as yet discovered in that class, — footsteps of wading and running birds coming before any trace of lower ornithic forms, and so forth, — I may re-

1. Intervals in the series were numerous in the department of the pachydermata; many of these gaps are now filled up from the extinct genera found in the tertiary formation.

fer to the partiality of all geological discovery, and the doubtfulness of all existing classification. In a succeeding chapter, such a view of the animal kingdom upon a strictly natural arrangement will be presented, as it is hoped will tend to abate many of these difficulties. For the rest, we may hope that more ample geological research will in time afford a sufficient explanation. In the meantime, the great facts stand free of all doubt. Invertebrate are inferior to vertebrate animals; the vertebrate are ranked in this order — fishes, reptiles, birds, mammals: such, too, is the order in which these creatures occur in the chronology of rock formations. So also it is undoubted that the earliest plants are acotyledons, the next monocotyledons, the next dicotyledons, and such is the acknowledged order of comparative organisation in that kingdom. It is equally important to remark that, amidst all the imperfection of the ancient series of animal forms, arising first from partiality in preservation, and second from partiality in discovery, many of the details as to families harmonise with even the obscure ideas of classification which at present reign amongst naturalists. Hence, it appears to me, there is strong reason to apprehend that, in the history of animated nature, a progress of some kind has been observed.

Now this progress involves two considerations: it is a progress which has observed a rule of time; it is a progress which has observed a rule of advancing organisation. Here we have two remarkable and perfectly definite ideas respecting the history of animated nature. A third rule will afterwards be seen to have affected organisation — namely, external conditions in the earth itself; but this we are not at present called upon to consider. Fixing attention meanwhile upon the facts that the organic kingdoms have been produced in the course of a long space of time and by steps of progressive improvement or advance, we readily see that, while the question of the Divine authorship of the universe remains exactly as it was, we can no longer rest satisfied with the common notions regarding the mode of working observed by that power in this instance. We call in question, not merely the simple idea of the unenlightened mind, that God fashioned all in the manner of an artificer seeking by special means to produce special effects, but even the doctrine in vogue amongst men of science, that 'creative fiats' were required for each new class, order, family, and species of organic beings, as they successively took their places upon the globe, or as the globe became gradually fitted for their reception. For, if such fiats were the mode of the Deity's operation, how should there have been oceans existing for unreckonable ages without fish, or dry land without land animals? How should the dry land have afterwards been possessed for ages by reptiles, without any superior animals, notwithstanding that we now find mammifers capable of living wherever reptiles can exist? Or why should there finally have been an age of inferior mammifers, without the presence of the highest order of being? And, in such a case, why should the supposed fiats have evoked being in this order, considering that there was nothing we can see in the condition of the earth in early ages to prevent fish from living in the sea before invertebrates, or mammifers from flourishing in the carboniferous woods before the rise of reptiles? It is startling, too, to think of this miraculous procedure being introduced in the midst of a system of things which was in every respect strictly natural — while seas were wearing down cliffs and forming new strata in their bosom, while forests grew and decayed, while the wind blew and the rain fell, exactly as at the present day. Nor is it less startling to regard it as following upon a series of operations much grander both in their character and results, which we know to have proceeded in the manner of natural law. The eternal Sovereign arranges a planetary or an astral

system by dispositions imparted primordially to matter; but he has to give a particular heed to the formation of the few corals and shell-fish in the Cambrian seas; he has by a new fiat to add fish, afterwards reptiles — birds — mammifers; and not only these great classes, but each particular species of which those classes are composed! In short, we are called upon by this theory to believe in a system of discrepancies and contradictions, to which it seems impossible for any candid and awakened mind to give credence.

It is under a humble sense of the difficulties which beset the presumption of extraordinary or extra-natural causes for the origin of the organic kingdoms; it is, I may say, in obedience to the hints and beckonings of nature herself: that I am led to inquire if there be any insurmountable obstacle to our embracing a rational modification of the opposite theory — namely, that species were introduced upon our globe by virtue of primordial arrangements having that object in view, and in which the Deity was only present and active in the sense in which he is so in all the phenomena of nature.

The hypothesis of an organic creation by natural law has, within the last two thousand years, been presented in various forms to mankind, but never has met with a hearty reception, the unenlightened mind greatly preferring the idea of a special mode of action suited to every contingency, and the philosophical mind resting generally at some point in this preference, to which it reconciled itself by reflecting that our knowledge did not enable us to arrive at a satisfactory conclusion with regard to the mode of the procedure implied. One great cause for the opposition made to the hypothesis was its being usually brought forward as something superseding the idea of an intelligent creative power, or at least being supposed to have this effect, so that there seemed only a choice between the doctrine of a deity acting for every occasion, and that of a cold and remote abstraction called nature. In reality, the hypothesis does not necessarily, in the least degree, supersede the Deity as the author and ruler of his works. It merely argues for one particular mode of acting instead of another, in one of the departments of his creation. It only would take one more section of the mundane economy out of the region of the supernatural in which ignorance would retain it all, and place it within that field of order to which it has been the tendency of all science to transfer the phenomena of the world.

As to any presumed bearing of the theory upon the character of the Creator, it might be enough to say that whatever it does in this respect, is certainly done in an equal degree by every other fact of nature which scientific knowledge has induced us to consider upon the footing of law. But I am unwilling to rest content with such a defence, and will add, that every advance we make in this direction, when rightly considered, affects our ideas of deity for the better. It is nothing less than a mean view of the Great Author, to suppose him obliged to come in on frequent occasions with new fiats or special interferences. It detracts immensely from his foresight, the grandest of all his attributes. The opposite doctrine supposes a much higher kind of power, exerted in an infinitely more sublime manner; not, be it always observed, a power which gave a first impulse and then retired into inaction, but one which, having pre-determined the universal scheme, sustains the whole of its complicated operations, in serene, immutable energy, present in the simplest phenomena as in the highest, never for a moment absent or asleep. 'If,' says Dr. Buckland, contemplating the possible establishment of this doctrine — 'if the properties adopted by the elements at the moment of their creation adapted them beforehand to the infinity of complicated useful purposes which they have already an-

swered, and may have still further to answer, under many dispensations of the material world, such an aboriginal constitution, *so far from superseding an intelligent agent, would only exalt our conceptions of the consummate skill and power that could comprehend such an infinity of future uses under future systems, in the original groundwork of his creation.'*

It may, however, be objected that the ideas of Christian nations on this subject are derived from an authority which does not admit of human reasonings upon their tendency or bearing. And, certainly, were that authority more forcible in its enunciations on this point than it is with regard to many other philosophical doctrines now fully admitted — such as the solar system of Copernicus — we might well feel that there was a difficulty in our path. But in reality such is not the case. There is hardly one of the admitted natural laws against which it would not be possible to bring, equally as against this, a powerful show of scriptural evidence, if we were to adopt in all those cases similar principles of interpretation. Yet more; if we look carefully, and with an awakened mind, into the scriptural record, we shall find the creative procedure represented in the first place, not as consisting in special efforts of the deity, but as resulting from commands or expressions of will. Let there be light — let there be a firmament — let the dry land appear — let the earth bring forth grass, the herb, the tree — let the sea bring forth the moving creature that hath life — let the earth bring forth the living creature after his kind — these are the terms in which the principal acts are described, conforming exactly to our ideas of natural laws. The additional expressions, God made the firmament — God made the beast of the earth, &c. — occur subordinately, and in comparatively few instances; they do not necessarily convey a different idea of the mode of creation, and indeed only appear as alternative phrases in the usual duplicative style of the east. There is thus, in what most persons will probably acknowledge as the source of their ideas on this subject certainly nothing like the decided affirmation of the doctrine of special exercise which has been assumed. Upon what, then, does this doctrine depend for the superior respectability arrogated for it, beyond its having been the first and the long entertained presumption of man — the presumption of his infancy and non-age? Was not the doctrine of the centrality of the earth exactly such a presumption till two centuries ago? equally a natural first impression of the human mind, and equally assumed to be sanctioned by Scripture, and yet proved unsound at last and now wholly given up? . . .

Hypothesis of the Development of the Vegetable and Animal Kingdoms

It thus appears, with regard to the constituent beings of large sections of the animal kingdom, that they are bound up in a fundamental unity, however various in degree of endowment and in the purposes which they serve in the world. They may be said to stand in a connexion analogous to that in which the planets are placed by the third law of Kepler. And the inference with regard to their origin is the same. Precisely as it is impossible to suppose a distinct exertion or fiat of Almighty Power for the formation of the earth, wrought up as it is in a complex dynamical connexion, first with Venus on the one hand and Mars on the other, and secondly with all the other members of the system, so is it impossible to conceive the same power using particular means for the production of a particular animal species, an individualised fraction, as it now appears, in a vast system which would not be complete without it, and into whose adjacent parts it melts by the finest shadings. Supposing, for a moment, that each species had been distinct in its origin, these shadings would

have been unnecessary; and there would at least have been a strong probability against a unity of organisation being assumed as part of the plan. In that case, abortive or rudimentary organs must have been considered as a kind of blemish — the thing of all others most irreconcilable with that idea of perfection which a general view of nature irresistibly attributes to its author. If, on the other hand, we admit that the animal kingdom took its rise in a general law, we see in the shadings and the organic unity something not only harmonious with, but essential to the system. Rudimentary organs, too, appear but as harmless peculiarities of development, and interesting evidences of the manner in which the Divine Author has been pleased to work.

We have yet to advert to the most interesting class of facts connected with our subject. First surmised by the illustrious Harvey, afterwards illustrated by Hunter in his wondrous collections at the Royal College of Surgeons, finally advanced to mature conclusions by Tiedemann, St. Hilaire, and Serres, embryotic development is now a science. Its primary positions are — 1. that the embryos of all animals are not distinguishably different from each other; and, 2. that those of all animals pass through a series of phases of development, each of which is the type or analogue of the permanent configuration of tribes inferior to it in the scale. With regard to the latter proposition, it is to be remarked that, while it is generally true of the whole forms of animal being, it is more particularly true of departments of the organisation, as the nutritive system, the vascular system, the nervous system, &c., each of which is destined for a peculiar degree of development in different groups of animals, according to their needs; and this, I may observe, is so far an explanation of the fact that a low class sometimes ascends in its highest forms to a point above the lowest forms of a class held on general grounds to be superior. Even in man there are some particulars of organisation less developed than in certain animals which generally are far inferior. Speaking, however, roundly, it is undoubted, respecting nearly all animals, that they pass in embryo through phases resembling the general as well as the particular characters of those of lower grade. For example, the comatula, a free-swimming star-fish, is, at one stage of its early progress, a crinoid — that is, a star-fish fixed upon a stalk at the bottom of the sea. It advances from the form of one of the lower to that of one of the higher echinodermata. The animals of its first form were, as we have seen, among the most abundant in the earliest fossiliferous rocks: they began to decline in the New Red Sandstone era, and they were succeeded in the Oolitic age by animals *of the form of the mature comatula*. Thus, too, the insect, standing near the head of the articulated animals, is, in the larva state, an annelid or worm, the annelides being the lowest in the same class. Of the earthworm, again, it has been observed that it passes through the forms of the polype, helianthois, and arenicola, before attaining its mature form. The higher crustacea, as the crab or lobster, at their escape from the ovum, resemble the perfect animal of the inferior order entomostraca, and pass through the forms of transition which characterise the intermediate tribes of crustacea. The salmon, a highly organised fish, exhibits, in its early stages, as has been remarked, the gelatinous dorsal cord, the heterocercal tail, and inferior position of the mouth, which mark the mature example of the cartilaginous fishes. The frog, again, for some time after its birth, is a fish with external gills, and other organs fitting it for an aquatic life, all of which are changed as it advances to maturity and becomes a land animal. The mammifer only passes through still more stages, according to its higher place in the scale. Nor is man himself exempt from this law. His first form is that which is

permanent in the animalcule His organisation gradually passes through conditions generally resembling a fish, a reptile, a bird, and the lower mammalia, before it attains its specific maturity. At one of the last stages of his foetal career, he exhibits an intermaxillary bone, which is characteristic of the perfect ape; this is suppressed, and he may then be said to take leave of the simial type, and become a true human creature. Even, as we shall find, the varieties of his race are represented in the progressive development of an individual of the highest, before we see the adult Caucasian, the highest point yet attained in the animal scale.

To come to particular points of the organisation. The brain of man, which exceeds that of all other animals in complexity of organisation and fulness of development, is, at one early period, only 'a simple fold of nervous matter, with difficulty distinguishable into three parts, while a little tail-like prolongation towards the higher parts, and which had been the first to appear, is the only representation of a spinal marrow. Now, in this state it perfectly resembles the brain of an adult fish, thus assuming *in transitu* the form that in the fish is permanent. In a short time, however, the structure is become more complex, the parts more distinct, and the spinal marrow better marked; it is now the brain of a reptile. The change continues; by a singular motion, certain parts (*corpora quadrigemina*) which had hitherto appeared on the upper surface, now pass towards the lower; the former is their permanent situation in fishes and reptiles, the latter in birds and mammalia. This is another advance in the scale, but more remains yet to be done. The complication of the organ increases; cavities termed *ventricles* are formed, which do not exist in fishes, reptiles, or birds; curiously organised parts, such as the corpora striata, are added; it is now the brain of the mammalia. Its last and final change alone seems wanting, that which shall render it the brain of MAN.' And this change in time takes place.

So also with the heart.

— Robert Chambers,
Vestiges of the Natural History of Creation (1844).

[NEWMAN ON THE DEVELOPMENT OF RELIGIOUS DOCTRINE]

Chapter I

On the Development of Ideas

SECTION I

ON THE PROCESS OF DEVELOPMENT IN IDEAS

It is a characteristic of our minds to be ever engaged in passing judgments on the things which come before them. No sooner do we learn, but we judge; we allow nothing to stand by itself: we compare, contrast, abstract, generalise, adjust, classify; and we view all our knowledge in the associations with which these processes have invested it.

Of the judgments thus exercised, some are mere opinions, which come and go, or remain with us only till an accident displaces them, whatever influence they may exert meanwhile. Others are firmly fixed in our minds and have a hold over us, whether they are principles of conduct, or are views of life and the world, or fall under the general head of belief. These habitual judgments often go by the name of ideas, and shall be called so here.

Of these ideas, — religious, political, or otherwise relating to human affairs, — some are real, that is, represent facts existing; and others are mere imaginations, and stand for nothing external to themselves. Thus the heathen mythology, or the Cartesian system of vortices, supplied a variety of ideas, which were but fanci-

ful and unreal; whereas the idea of a saint, or a hero, or a tyrant, or what are called the laws of motion, are the representatives of things.

Ideas thus described, being of the nature of judgments, must, properly speaking, be considered as true by those who hold them. The absence, however, of this condition of course does not change their nature: thus poets are familiar with fable; orators and pleaders make a case or embellish a character; and philosophers lay down some great principle, not necessarily as representing a fact, but as a generalisation of phenomena, convenient, fact or not, for the purposes of science.

The number of persons holding an idea is no warrant for its objective character, else the many never could be wrong; for uniformity of education, or the sympathy kindled by enthusiasm, may carry many minds into one state, in which belief in certain ideas, and the mistake of formulae or usages for external truths, will be natural or necessary. Such are popular superstitions; or the law of honour, as professed by men of the world; or the heated notions created by mob oratory; all of which are as baseless and untrue as they are influential. Again, a whole train of investigation or inference may depend on the original admission of some one proposition which is false; and the consequent unanimity with which separate minds regard and treat the same matters may be unfairly taken as a concurrent evidence of the truth of the conclusions at which they arrive.

But when one and the same idea is held by persons who are independent of each other, and are variously circumstanced, and have possessed themselves of it by different ways, and when it presents itself to them under very different aspects, without losing its substantial unity and its identity, and when it is thus variously presented, yet recommended, to persons similarly circumstanced; and when it is presented to persons variously circumstanced, under aspects, discordant indeed at first sight, but reconcilable after such explanations as their respective states of mind require; then it seems to have a claim to be considered the representative of an objective truth. . . .

An idea ever presents itself under different aspects to different minds, and in proportion to that variety will be the proof of its reality and its distinctness. On the other hand, meagre and monotonous statements, and those simply reiterated, as in the case of the Ephesian clamour, betoken ideas which are unreal, or which are not properly understood by the speakers. Or such characteristics denote mystery, that is, dim information taken on faith: as we see in the theological enunciations of Scripture.

Ideas are not ordinarily brought home to the mind, except through the medium of a variety of aspects; like bodily substances, which are not seen except under the clothing of their properties and influences, and can be walked round and surveyed on opposite sides and in different perspectives and in contrary lights. And as views of a material object may be taken from points so remote or so distinct that they seem at first sight incompatible, and especially as their shadows will be disproportionate or even monstrous, and yet all these will be harmonised together by taking account of the point of vision or the surface of projection, so also all the representations of an idea, even all the misrepresentations, are capable of a mutual reconciliation and adjustment, and of a resolution into the subject to which they belong, and their contrariety, when explained, is an argument for its substantiveness and integrity, and their variety for its originality and power.

For instance, persons who have not cultivated the science of music are often slow to believe that the harmonies of its great masters are more than a display of skill, or than literally a composition, which falls

in with the fancy of particular persons, and is taken up by others as a fashion; as though its laws were conventional, and proficiency in it a mere successful application of general talent to a medium of exhibition accidentally chosen, and as if the satisfaction it affords were felt not spontaneously but upon rule, the mere approbation of those who were witnessing instances of conformity to principles which they had themselves arbitrarily propounded: that is, they do not believe in the existence of truths or laws about the beauty of sounds in the nature of things, external to particular minds, affecting various persons variously, and mastered by them in various degrees, as the case may be. An instance in point may be mentioned of a person under this impression, who was greatly astonished to be told by another who had some knowledge of the art, and a sensibility to musical creations, that, in spite of this, he was not able to compose; for he took it for granted that any one of fair abilities who knew the rules could put them into practice, and impart to himself a pleasure which was of his own making. But ideas which are conversant with realities are not ours at will, but then only and as far as is given us; and they present themselves very variously, and in various measures to individual minds.

Since an idea, as has been already said, cannot be viewed except under particular aspects, the formal statements under which it is conveyed are practically identical with itself. They introduce us to that idea from which they are derived, and, so far as they seem to oppose, they correct each other, and serve to impress a fuller and more exact representation of their original upon the mind.

And hence, if the illustration on which we are proceeding be correct, there is no one aspect such, as to go the depth of a real idea, no one term or proposition which can duly and fully represent it; though of course one representation of it will be more just and appropriate than another, and though when an idea is very complex, it is allowable to consider its distinct aspects as if separate ideas, for the sake of convenience. Thus, with all our intimate knowledge of animal life, and the structure of particular animals, we cannot give a true definition of any one of them, but are forced to enumerate properties and accidents by way of description. Nor can we enclose in a formula that intellectual fact, or system of thought, which we call the Platonic philosophy, or that historical phenomenon of doctrine and conduct which we call the heresy of Montanus or of Manes. Again, if Protestantism were said to lie in its theory of private judgment, and Lutheranism in its doctrine of justification, this would be an approximation to the truth; but it is plain that to argue or to act as if these were adequate definitions would be a serious mistake. Sometimes an attempt has been made to ascertain the 'leading idea,' as it has been called, of Christianity; a remarkable essay as directed towards a divine religion, when, even in the existence of the works of man, the task is beyond us. Thus, the one idea of the Gospel has been decided by some to be the restoration of our fallen race, by others philanthropy, by others the spirituality of true religious service, by others the salvation of the elect, by others the union of the soul with God. All these representations are truths, as being aspects of Christianity, but none of them is the whole truth. For Christianity has many aspects: it has its imaginative side, its philosophical, its ethical, its political; it is solemn, and it is cheerful; it is indulgent, and it is strict; it is light, and it is dark; it is love, and it is fear.

When an idea, whether real or not, is of a nature to interest and possess the mind, it is said to have life, that is, to live in the mind which is the recipient of it. Thus, mathematical ideas, real as they are, cannot be called living, for they have no influence and lead to nothing. But when

some great enunciation, whether true or false, about human nature, or present good, or government, or duty, or religion, is carried forward into the public throng and draws attention, then it is not only passively admitted in this or that form into the minds of men, but it becomes a living principle within them, leading them to an ever-new contemplation of itself, an acting upon it and a propagation of it. Such is the doctrine of the natural bondage of the will, or of individual responsibility, or of the immortality of the soul, or of the rights of man, or of the divine right of kings, or of the hypocrisy and tyranny of priestcraft, or of the lawfulness of self-indulgence, — doctrines which are of a nature to arrest, attract, or persuade, and have so far the *primâ facie* appearance of reality that they may be looked at on many sides and strike various minds very variously. Let one such idea get possession of the popular mind, or the mind of any set of persons, and it is not difficult to understand the effects which will ensue. There will be a general agitation of thought, and an action of mind both upon itself and upon other minds. New lights will be brought to bear upon the original idea, aspects will multiply, and judgments will accumulate. There will be a time of confusion, when conceptions and misconceptions are in conflict; and it is uncertain whether anything is to come of the idea at all, or which view of it is to get the start of the others. After a while some definite form of doctrine emerges; and, as time proceeds, one view of it will be modified or expanded by another, and then, combined with a third, till the idea in which they centre will be to each mind separately what at first it was only to all together. It will be surveyed, too, in its relation to other doctrines or facts, to other natural laws or established rules, to the varying circumstances of times and places, to other religions, polities, philosophies, as the case may be. How it stands affected towards other systems, how it affects them, how far it coalesces with them, how far it tolerates, when it interferes with them, will be gradually wrought out. It will be questioned and criticised by enemies, and explained by well-wishers. The multitude of opinions formed concerning it, in these respects and many others, will be collected, compared, sorted, sifted, selected, or rejected, and gradually attached to it, or separated from it, in the minds of individuals and of the community. It will, in proportion to its native vigour and subtlety, introduce itself into the framework and details of social life, changing public opinion and supporting or undermining the foundations of established order. Thus in time it has grown into an ethical code, or into a system of government, or into a theology, or into a ritual, according to its capabilities; and this system, or body of thought, theoretical and practical, thus laboriously gained, will after all be only the adequate representation of the original idea, being nothing else than what that very idea *meant* from the first, — its exact image as seen in a combination of the most diversified aspects, with the suggestions and corrections of many minds, and the illustration of many trials.

This process is called the development of an idea, being the germination, growth, and perfection of some living, that is, influential truth, or apparent truth, in the minds of men during a sufficient period. And it has this necessary characteristic, — that, since its province is the busy scene of human life, it cannot develop at all, except either by destroying, or modifying and incorporating with itself, existing modes of thinking and acting. Its development then is not like a mathematical theorem worked out on paper, in which each successive advance is a pure evolution from a foregoing, but it is carried on through individuals and bodies of men; it employs their minds as instruments, and depends upon them while it uses them.

And so as regards their existing opinions, principles, measures, and institutions, it develops in establishing relations between them and itself, in giving them a meaning, in creating what may be called a jurisdiction over them, in throwing off from itself what is utterly heterogeneous in them. It grows when it incorporates; and its purity consists, not in isolation, but in its continuity and sovereignty. This it is which imparts to the history both of states and of religions its especially turbulent or polemical character. Such is the explanation of the wranglings whether of Schools or of Parliaments. It is the warfare of ideas, striving for the mastery, each of them enterprising, engrossing, imperious, more or less incompatible with the rest, and rallying followers or rousing foes according as it acts upon the faith, the prejudices, or the interests of individuals.

Moreover, an idea not only modifies, but, as has been implied, is modified or at least influenced by the state of things in which it is carried out, and depends in various ways on the circumstances around it. Its development proceeds quickly or slowly; the order of succession in its separate stages is irregular; it will show differently in a small sphere of action and in an extended; it may be interrupted, retarded, mutilated, distorted, by external violence; it may be enfeebled by the effort of ridding itself of domestic foes; it may be impeded and swayed or even absorbed by counter energetic ideas; it may be coloured by the received tone of thought into which it comes, or depraved by the intrusion of foreign principles, or at length shattered by the development of some original fault within it.

But, whatever be the risk of corruption from intercourse with the world around it, such a risk must be undergone, if it is duly to be understood, and much more if it is to be fully exhibited. It is elicited by trial, and struggles into perfection. Nor does it escape the collision of opinion even in its earlier years; nor does it remain truer to itself, and more one and the same, though protected from vicissitude and change. It is indeed sometimes said that the stream is clearest near the spring. Whatever use may fairly be made of this image, it does not apply to the history of a philosophy or sect, which, on the contrary, is more equable, and purer, and stronger, when its bed has become deep, and broad, and full. It necessarily rises out of an existing state of things, and, for a time, savours of the soil. Its vital element needs disengaging from what is foreign and temporary, and is employed in efforts after freedom, more vigorous and hopeful as its years increase. Its beginnings are no measure of its capabilities, nor of its scope. At first, no one knows what it is, or what it is worth. It remains perhaps for a time quiescent: it tries, as it were, its limbs, and proves the ground under it, and feels its way. From time to time, it makes essays which fail, and are in consequence abandoned. It seems in suspense which way to go; it wavers, and at length strikes out in one definite direction. In time it enters upon strange territory; points of controversy alter their bearing; parties rise and fall about it; dangers and hopes appear in new relations, and old principles reappear under new forms; it changes with them in order to remain the same. In a higher world it is otherwise; but here below to live is to change, and to be perfect is to have changed often. . . .

SECTION III

ON THE CORRUPTION OF AN IDEA

2. FIRST TEST OF A TRUE DEVELOPMENT; PRESERVATION OF IDEA

That the essential idea or type which a philosophical or political system represents must continue under all its developments, and that its loss is tantamount to the corruption of the system, will scarcely

be denied. When, for instance, we pronounce a monastic institution to have been in a state of corruption, we mean that it had departed from the views or professions in which it is founded. Judges are corrupt, when they are guided in their decisions, not by justice and truth, but by the love of lucre or respect of persons. Severity in living may be carried to excess as well as indulgence; but we predicate corruption, not of the extreme, which preserves, but of that which destroys, the type of self-restraint. . . .

3. SECOND TEST; CONTINUITY OF PRINCIPLES

As in mathematical creations figures are formed on distinct formulae, which are the laws under which they are developed, so it is in ethical and political subjects. Doctrines expand variously according to the mind, individual or social, into which they are received; and the peculiarities of the recipient are the regulating power, the law, the organisation, or, as it may be called, the form of the development. The life of doctrines may be said to consist in the law or principle which they embody. . . .

5. THE THIRD TEST; POWER OF ASSIMILATION

In the physical world whatever has life is characterised by growth, so that in no respect to grow is to cease to live. It grows by taking into its own substance external materials; and this absorption or assimilation is completed when the materials appropriated come to belong to it or enter into its unity. Two things cannot become one, except there be a power of assimilation in one or the other. Sometimes assimilation is effected only with an effort; it is possible to die of repletion, and there are animals who lie torpid for a time under the contest between the foreign substance and the assimilating power. And different food is proper for different recipients. . . .

6. THE FOURTH TEST; EARLY ANTICIPATION

Since, when an idea is living, that is, influential and operative in the minds of recipients, it is sure to develop according to the principles on which they are formed; instances of such a process, though vague and isolated, may occur from the very first, though a lapse of time be necessary to bring it to perfection. And since developments are in great measure only aspects of the idea from which they come, and all of them are natural consequences of it, it is often a matter of accident in what order they are carried out in individual minds; and it is no wise strange that here and there definite specimens should very early occur, which in the historical course are not found till a late day. The fact, then, of such early or recurring intimations of tendencies, which afterwards are fully realised, is a sort of evidence that those later and more systematic fulfilments are but in accordance with the original idea. . . .

7. THE FIFTH TEST; LOGICAL SEQUENCE

Though it is a matter of accident in what order or degree developments of a common idea will show themselves in this or that place, particular minds or communities taking different courses, yet on a large field they will on the whole be gradual and orderly, nay, in *logical sequence*. It may be asked whether a development is itself a logical process; and if by this is meant a conscious reasoning from premisses to conclusion, of course the answer must be in the negative. An idea grows in the mind by remaining there; it becomes familiar and distinct, and is viewed in its relations; it suggests other ideas, and these again others, subtle, recondite, original, according to the character, intellectual and moral, of the recipient; and thus a body of thought is gradually formed without his recognising what is going on within him. And all this while, or at least from

time to time, external circumstances elicit into formal statement the thoughts which are coming into being in the depths of his mind; and soon he has to begin to defend them; and then again a further process must take place, of analysing his statements and ascertaining their dependence one on another. And thus he is led to regard as consequences, and to trace to principles, what hitherto he has discerned by a moral perception, and adopted on sympathy; and logic is brought in to arrange and inculcate what no science was employed in gaining. . . .

A specimen of logical development, most interesting, though most painfully so, is afforded us in the history of Lutheranism as it has of late years been drawn out by various English writers. Luther started on a double basis, his dogmatic principle being contradicted by his right of private judgment, and his sacramental by his theory of justification. The sacramental element never showed signs of life; but on his death, that which he represented in his own person as a teacher, the dogmatic, gained the ascendancy; and 'every expression of his upon controverted points became a norm for the party, which, at all times the largest, was at last coextensive with the Church itself. This almost idolatrous veneration was perhaps increased by the selection of declarations of faith, of which the substance on the whole was his, for the symbolical books of his Church.' Next a reaction took place; private judgment was restored to the supremacy. Calixtus put reason, and Spener the so-called religion of the heart, in the place of dogmatic correctness. Pietism for the present died away; but rationalism developed in Wolf, who professed to prove all the orthodox doctrines, by a process of reasoning, from premisses level with the reason. It was soon found that the instruments which Wolf had used for orthodoxy, could as plausibly be used against it; — in his hands it had proved the Creed; in the hands of Semler, Ernesti, and others, it disproved the authority of Scripture. What was religion to be made to consist in now? A sort of philosophical Pietism followed; or rather Spener's pietism and the original theory of justification were analysed more thoroughly, and issued in various theories of Pantheism, which from the first was at the bottom of Luther's doctrine and personal character. And this appears to be the state of Lutheranism at present, whether we view it in the philosophy of Kant, in the open infidelity of Strauss, or in the religious professions of the new Evangelical Church of Prussia. Applying this instance to the subject which it has been brought to illustrate, I should say that the equable and orderly march and natural succession of views, by which the creed of Luther has been changed into the infidel or heretical philosophy of his present representatives, is a proof that that change is no perversion or corruption, but a faithful development of the original idea. . . .

8. THE SIXTH TEST; PRESERVATIVE ADDITIONS

As developments which are preceded by definite indications have a fair presumption in their favour, so those which do but contradict and reverse the course of doctrine which has been developed before them, and out of which they spring, are certainly corrupt; for a corruption is a development in that very stage in which it ceases to illustrate, and begins to prejudice, the acquisitions gained in its previous history. . . .

A true development, then, may be described as one which is conservative of the course of development which went before it, which is that development and something besides: it is an addition which illustrates, not obscures, corroborates, not corrects, the body of thought from which it proceeds; and this is its characteristic as contrasted with a corruption. . . .

9. THE SEVENTH TEST; CHRONIC CONTINUANCE

Since the corruption of an idea, as far as the appearance goes, is a sort of accident or affection of its development, being the end of a course, and a transition-state leading to a crisis, it is, as has been observed, a brief and rapid process. While ideas live in men's minds, they are ever enlarging into fuller development; they will not be stationary in their corruption any more than before it; and dissolution is that further state to which corruption tends. Corruption cannot, therefore, be of long standing; and thus *duration* is another test of a faithful development. . . .

— JOHN HENRY NEWMAN,
The Development of Christian Doctrine (1845).

[MARX AND ENGELS ON SOCIAL EVOLUTION THROUGH CLASS STRUGGLE]

THE history of all hitherto existing society is the history of class struggles.

Freeman and slave, patrician and plebeian, lord and serf, guildmaster and journeyman, in a word, oppressor and oppressed, stood in constant opposition to one another, carried on an uninterrupted, now hidden, now open fight, a fight that each time ended, either in a revolutionary reconstitution of society at large, or in the common ruin of the contending classes.

In the earlier epochs of history we find almost everywhere a complicated arrangement of society into various orders, a manifold gradation of social rank. In ancient Rome we have patricians, knights, plebeians, slaves; in the Middle Ages, feudal lords, vassals, guildmasters, journeymen, apprentices, serfs; in almost all of these classes, again, subordinate gradations.

The modern bourgeois society that has sprouted from the ruins of feudal society has not done away with class antagonisms. It has but established new classes, new conditions of oppression, new forms of struggle in place of the old ones.

Our epoch, the epoch of the bourgeoisie, possesses, however, this distinctive feature; it has simplified the class antagonisms. Society as a whole is more and more splitting up into two great hostile camps, into two great classes directly facing each other: Bourgeoisie and Proletariat.

From the serfs of the Middle Ages sprang the chartered burghers of the earliest towns. From these burgesses the first elements of the bourgeoisie were developed.

The discovery of America, the rounding of the Cape, opened up fresh ground for the rising bourgeoisie. The East Indian and Chinese markets, the colonisation of America, trade with the colonies, the increase in the means of exchange and in commodities generally, gave to commerce, to navigation, to industry, an impulse never before known, and thereby, to the revolutionary element in the tottering feudal society, a rapid development.

The feudal system of industry, under which industrial production was monopolized by close guilds, now no longer sufficed for the growing wants of the new market. The manufacturing system took its place. The guild masters were pushed on one side by the manufacturing middle class; division of labour between the different corporate guilds vanished in the face of division of labour in each single workshop.

Meantime the markets kept ever growing, the demand ever rising. Even manufacture no longer sufficed. Thereupon, steam and machinery revolutionised industrial production. The place of manufacture was taken by the giant Modern Industry, the place of the industrial middle class, by industrial millionaires, the leaders

of whole industrial armies, the modern bourgeois.

Modern industry has established the world-market, for which the discovery of America paved the way. This market has given an immense development to commerce, to navigation, to communication by land. This development has, in its turn, reacted on the extension of industry; and in proportion as industry, commerce, navigation, railways extended, in the same proportion the bourgeoisie developed, increased its capital, and pushed into the background every class handed down from the Middle Ages.

We see, therefore, how the modern bourgeoisie is itself the product of a long course of development, of a series of revolutions in the modes of production and of exchange.

Each step in the development of the bourgeoisie was accompanied by a corresponding political advance of that class. An oppressed class under the sway of the feudal nobility; an armed and self-governing association in the medieval commune, (here independent urban republic, as in Italy and Germany, there taxable 'third estate' of the monarchy, as in France); afterwards, in the period of manufacture proper, serving either the semi-feudal or the absolute monarchy as a counterpoise against the nobility, and, in fact, corner stone of the great monarchies in general — the bourgeoisie has at last, since the establishment of modern industry and of the world-market, conquered for itself, in the modern representative State, exclusive political sway. The executive of the modern State is but a committee for managing the common affairs of the whole bourgeoisie.

The bourgeoisie, historically, has played a most revolutionary part.

The bourgeoisie, wherever it has got the upper hand, has put an end to all feudal, patriarchal, idyllic relations. It has pitilessly torn asunder the motley feudal ties that bound man to his 'natural superiors,' and has left no other nexus between man and man than naked self-interest, than callous 'cash payment.' It has drowned the most heavenly ecstasies of religious fervour, of chivalrous enthusiasm, of philistine sentimentalism, in the icy water of egotistical calculation. It has resolved personal worth into exchange value, and in place of the numberless indefeasible chartered freedoms, has set up that single, unconscionable freedom — Free Trade. In one word, for exploitation, veiled by religious and political illusions, it has substituted naked, shameless, direct, brutal exploitation.

The bourgeoisie has stripped of its halo every occupation hitherto honoured and looked up to with reverent awe. It has converted the physician, the lawyer, the priest, the poet, the man of science, into its paid wage labourers.

The bourgeoisie has torn away from the family its sentimental veil, and has reduced the family relation to a mere money relation.

The bourgeoisie has disclosed how it came to pass that the brutal display of vigour in the Middle Ages, which reactionists so much admire, found its fitting complement in the most slothful indolence. It has been the first to show what man's activity can bring about. It has accomplished wonders far surpassing Egyptian pyramids, Roman aqueducts, and Gothic cathedrals; it has conducted expeditions that put in the shade all former Exoduses of nations and crusades.

The bourgeoisie cannot exist without constantly revolutionizing the instruments of production, and thereby the relations of production, and with them the whole relations of society. Conservation of the old modes of production in unaltered form was, on the contrary, the first condition of existence for all earlier industrial classes. Constant revolutionising of production, uninterrupted disturbance of all social conditions, everlasting uncertainty and agitation distinguish the bourgeois epoch from

all earlier ones. All fixed, fast-frozen relations, with their train of ancient and venerable prejudices and opinions, are swept away, all new-formed ones become antiquated before they can ossify. All that is solid melts into the air, all that is holy is profaned, and man is at last compelled to face with sober senses, his real conditions of life, and his relations with his kind.

The need of a constantly expanding market for its products drives the bourgeoisie over the whole surface of the globe. It must elbow-in everywhere, settle everywhere, establish connexions everywhere.

The bourgeoisie has through its exploitation of the world-market given a cosmopolitan character to production and consumption in every country. To the great chagrin of reactionists, it has drawn from under the feet of industry the national ground on which it stood. All old-established national industries have been destroyed or are daily being destroyed. They are dislodged by new industries, whose introduction becomes a life and death question for all civilised nations, by industries that no longer work up indigenous raw material, but raw material drawn from the remotest zones; industries whose products are consumed, not only at home, but in every quarter of the globe. In place of the old wants, satisfied by the productions of the country, we find new wants, requiring for their satisfaction the products of distant lands and climes. In place of the old local and national seclusion and self sufficiency, we have intercourse in every direction, universal interdependence of nations. And as in material, so also in intellectual production. The intellectual creations of individual nations become common property. National one-sidedness and narrow-mindedness become more and more impossible, and from the numerous national and local literatures there arises a world-literature.

The bourgeoisie, by the rapid improvement of all instruments of production, by the immensely facilitated means of communication, draws all, even the most barbarian nations, into civilisation. The cheap prices of its commodities are the heavy artillery with which it batters down all Chinese walls, with which it forces the barbarians' intensely obstinate hatred of foreigners to capitulate. It compels all nations, on pain of extinction, to adopt the bourgeois mode of production; it compels them to introduce what it calls civilisation into their midst, *i.e.*, to become bourgeois themselves. In a word, it creates a world after its own image.

The bourgeoisie has subjected the country to the rule of the towns. It has created enormous cities, has greatly increased the urban population as compared with the rural, and has thus rescued a considerable part of the population from the idiocy of rural life. Just as it has made the country dependent on the towns, so it has made barbarian and semi-barbarian countries dependent on civilised ones, nations of peasants on nations of bourgeois, the East on the West.

The bourgeoisie keeps more and more doing away with the scattered state of the population, of the means of production, and of property. It has agglomerated population, centralised means of production, and has concentrated property in a few hands. The necessary consequence of this was political centralisation. Independent, or but loosely connected provinces, with separate interests, laws, governments, and systems of taxation, became lumped together in one nation, with one government, one code of laws, one national class-interest, one frontier and one customs' tariff.

The bourgeoisie, during its rule of scarce one hundred years, has created more massive and more colossal productive forces than have all preceding generations together. Subjection of nature's forces to man, machinery, application of chemistry to industry and agriculture, steam-navigation, railways, electric telegraphs, clearing

of whole continents for cultivation, canalisation of rivers, whole populations conjured out of the ground — what earlier century had even a presentiment that such productive forces slumbered in the lap of social labor?

We see then: the means of production and of exchange on whose foundation the bourgeoisie built itself up, were generated in feudal society. At a certain stage in the development of these means of production and of exchange, the conditions under which feudal society produced and exchanged, the feudal organisation of agriculture and manufacturing industry — in one word, the feudal relations of property — became no longer compatible with the already developed productive forces; they became so many fetters. They had to burst asunder; they were burst asunder.

Into their places stepped free competition, accompanied by a social and political constitution adapted to it, and by the economical and political sway of the bourgeois class.

A similar movement is going on before our own eyes. Modern bourgeois society with its relations of production, of exchange, and of property, a society that has conjured up such gigantic means of production and of exchange, is like the sorcerer, who is no longer able to control the powers of the nether world whom he has called up by his spells. For many a decade past, the history of industry and commerce is but the history of the revolt of modern productive forces against modern conditions of production, against the property relations that are the conditions for the existence of the bourgeoisie and of its rule. It is enough to mention the commercial crises that by their periodical return put on its trial, each time more threateningly, the existence of the entire bourgeois society. In these crises a great part not only of the existing products, but also of the previously created productive forces, are periodically destroyed. In these crises there breaks out an epidemic that, in all earlier epochs, would have seemed an absurdity — the epidemic of over-production. Society suddenly finds itself put back into a state of momentary barbarism; it appears as if a famine, a universal war of devastation, had cut off the supply of every means of subsistence; industry and commerce seem to be destroyed; and why? Because there is too much civilisation, too much means of subsistence, too much industry, too much commerce. The productive forces at the disposal of society no longer tend to further the development of the conditions of bourgeois property; on the contrary, they have become too powerful for these conditions by which they are confined, and as soon as they overcome these limitations they bring disorder into the whole bourgeois society, endanger the existence of bourgeois property. The conditions of bourgeois society are too narrow to comprise the wealth created by them. And how does the bourgeoisie get over these crises? On the one hand by enforced destruction of a mass of productive forces; on the other, by the conquest of new markets, and by the more thorough exploitation of the old ones. That is to say, by paving the way for more extensive and more destructive crises, and by diminishing the means whereby crises are prevented.

The weapons with which the bourgeoisie felled feudalism to the ground are now turned against the bourgeoisie itself.

But not only has the bourgeoisie forged the weapons that bring death to itself; it has also called into existence the men who are to wield those weapons — the modern working class — the proletarians.

In proportion as the bourgeoisie, that is, capital, is developed, in the same proportion is the proletariat, the modern working class, developed, a class of labourers who live only so long as they find work, and who find work only so long as their labour increases capital. These labourers, who must sell themselves piecemeal, are a commodity, like every other article of com-

merce, and are consequently exposed to all the vicissitudes of competition, to all the fluctuations of the market.

Owing to the extensive use of machinery and to division of labour, the work of the proletarians has lost all individual character, and, consequently, all charm for the workman. He becomes an appendage of the machine, and it is only the most simple, most monotonous, and most easily acquired knack that is required of him. Hence, the cost of production of a workman is restricted almost entirely to the means of subsistence that he requires for his maintenance, and for the propagation of his race. But the price of a commodity and also of labour is equal to its cost of production. In proportion, therefore, as the repulsiveness of the work increases, the wage decreases. Nay more, in proportion as the use of machinery and division of labour increase, in the same proportion the burden of toil increases, whether by prolongation of the working hours, by increase of the work enacted in a given time, or by increased speed of the machinery, and so forth.

Modern industry has converted the little workshop of the patriarchal master into the great factory of the industrial capitalist. Masses of labourers, crowded into factories, are organised like soldiers. As privates of the industrial army they are placed under the command of a perfect hierarchy of officers and sergeants. Not only are they the slaves of the bourgeois class and of the bourgeois state, they are daily and hourly enslaved by the machine, by the foreman, and, above all, by the individual bourgeois manufacturer himself. The more openly this despotism proclaims gain to be its end and aim, the more petty, the more hateful and the more embittering it is.

The less the skill and exertion or strength implied in manual labour, in other words, the more modern industry becomes developed, the more is the labour of men superseded by that of women. Differences of age and sex have no longer any distinctive social validity for the working class. All are instruments of labour, more or less expensive to use, according to their age and sex.

No sooner is the exploitation of the labourer by the manufacturer so far at an end that he receives his wages in cash, than he is set upon by the other portions of the bourgeoisie, the landlord, the shopkeeper, the pawnbroker, and so forth.

The lower strata of the middle class — the small tradespeople, shopkeepers and retired tradesmen generally, the handicraftsmen and peasants — all these sink gradually into the proletariat, partly because their diminutive capital does not suffice for the scale on which modern industry is carried on, and is swamped in the competition with the large capitalists, partly because their specialized skill is rendered worthless by new methods of production. Thus the proletariat is recruited from all classes of the population.

The proletariat goes through various stages of development. With its birth begins its struggle with the bourgeoisie. At first the contest is carried on by individual labourers, then by the workpeople of a factory, then by the operatives of one trade in one locality, against the individual bourgeois who directly exploits them. They direct their attacks not against the bourgeois conditions of production, but against the instruments of production themselves; they destroy imported wares that compete with their labour, they smash machinery, they set factories ablaze, they seek to restore by force the vanished status of the workman of the Middle Ages.

At this stage the labourers still form an incoherent mass scattered over the whole country, and broken up by their mutual competition. If anywhere they unite to form more compact bodies, this is not yet the consequence of their own active union, but of the union of the bourgeoisie, which class, in order to attain its own political ends, is compelled to set the whole proletariat in motion, and is moreover, for

a time, still able to do so. At this stage, therefore, the proletarians do not fight their enemies, but the enemies of their enemies, the remnants of absolute monarchy, the landowners, the non-industrial bourgeois, the petty bourgeoisie. Thus the whole historical movement is concentrated in the hands of the bourgeoisie, every victory so obtained is a victory for the bourgeoisie.

But with the development of industry the proletariat not only increases in number; it becomes concentrated in greater masses, its strength grows and it feels that strength more. The various interests and conditions of life within the ranks of the proletariat are more and more equalised, in proportion as machinery obliterates all distinctions of labour, and nearly everywhere reduces wages to the same low level. The growing competition among the bourgeois, and the resulting commercial crises, make the wages of the workers ever more fluctuating; the unceasing improvement of machinery, ever more rapidly developing, makes their livelihood more and more precarious; the collisions between individual workmen and individual bourgeois take more and more the character of collisions between two classes. Thereupon the workers begin to form combinations (trade unions) against the bourgeois; they club together in order to keep up the rate of wages; they found permanent associations in order to make provision beforehand for these occasional revolts. Here and there the contest breaks out into riots.

Now and then the workers are victorious, but only for a time. The real fruit of their battle lies not in the immediate result, but in the ever expanding union of workers. This union is helped on by the improved means of communication that are created by modern industry, and that places the workers of different localities in contact with one another. It was just this contact that was needed to centralise the numerous local struggles, all of the same character, into one national struggle between classes. But every class struggle is a political struggle. And that union, to attain which the burghers of the Middle Ages with their miserable highways, required centuries, the modern proletarians, thanks to railways, achieve in a few years.

This organisation of the proletarians into a class, and consequently into a political party, is continually being upset again by the competition between the workers themselves. But it ever rises up again, stronger, firmer, mightier. It compels legislative recognition of particular interests of the workers by taking advantage of the divisions among the bourgeoisie itself. Thus the Ten-Hours-Bill in England was carried.

Altogether collisions between the classes of the old society further, in many ways, the development of the proletariat. The bourgeoisie finds itself involved in a constant battle — at first with the aristocracy; later on, with those portions of the bourgeoisie itself whose interests have become antagonistic to the progress of industry; at all times, with the bourgeoisie of foreign countries. In all these battles it sees itself compelled to appeal to the proletariat, to ask for its help, and thus to drag it into the political arena. The bourgeoisie itself, therefore, supplies the proletariat with its own elements of political and general education; in other words, it furnishes the proletariat with weapons for fighting the bourgeoisie.

Further, as we have already seen, entire sections of the ruling classes are, by the advance of industry, precipitated into the proletariat, or are at least threatened in their conditions of existence. These also supply the proletariat with fresh elements of enlightenment and progress.

Finally, in times when the class-struggle nears the decisive hour, the process of dissolution going on within the ruling class, in fact within the whole range of an old society, assumes such a violent, glaring character that a small section of the ruling class cuts itself adrift and joins the revolutionary class, the class that holds

the future in its hands. Just as, therefore, at an earlier period, a section of the nobility went over to the bourgeoisie, so now a portion of the bourgeoisie goes over to the proletariat, and in particular, a portion of the bourgeois ideologists, who have raised themselves to the level of comprehending theoretically the historical movements as a whole.

Of all the classes that stand face to face with the bourgeoisie today the proletariat alone is a really revolutionary class. The other classes decay and finally disappear in the face of modern industry; the proletariat is its special and essential product.

The lower middle class, the small manufacturer, the shopkeeper, the artisan, the peasant, all these fight against the bourgeoisie, to save from extinction their existence as fractions of the middle class. They are therefore not revolutionary, but conservative. Nay, more; they are reactionary, for they try to roll back the wheel of history. If by chance they are revolutionary, they are so only in view of their impending transfer into the proletariat; they thus defend not their present, but their future interests; they desert their own standpoint to place themselves at that of the proletariat.

The 'dangerous class,' the social scum, that passively rotting mass thrown off by the lowest layers of the old society, may here and there be swept into the movement by a proletarian revolution; its conditions of life, however, prepare it far more for the part of a bribed tool of reactionary intrigue.

In the conditions of the proletariat, those of old society at large are already virtually swamped. The proletarian is without property; his relation to his wife and children has no longer anything in common with the bourgeois family relations; modern industrial labour, modern subjection to capital, the same in England as in France, in America as in Germany, has stripped him of every trace of national character. Law, morality, religion, are to him so many bourgeois prejudices, behind which lurk in ambush just as many bourgeois interests.

All the preceding classes that got the upper hand sought to fortify their already acquired status by subjecting society at large to their conditions of appropriation. The proletarians cannot become masters of the productive forces of society, except by abolishing their own previous mode of appropriation, and thereby also every other previous mode of appropriation. They have nothing of their own to secure and to fortify; their mission is to destroy all previous securities for and insurances of individual property.

All previous historical movements were movements of minorities, or in the interest of minorities. The proletarian movement is the self-conscious, independent movement of the immense majority. The proletariat, the lowest stratum of our present society, cannot stir, cannot raise itself up without the whole superincumbent strata of official society being sprung into the air.

Though not in substance, yet in form, the struggle of the proletariat with the bourgeoisie is at first a national struggle. The proletariat of each country must, of course, first of all settle matters with its own bourgeoisie.

In depicting the most general phases of the development of the proletariat, we have traced the more or less veiled civil war, raging within existing society, up to the point where that war breaks out into open revolution, and where the violent overthrow of the bourgeoisie, lays the foundation for the sway of the proletariat.

Hitherto every form of society has been based, as we have already seen, on the antagonism of oppressing and oppressed classes. But in order to oppress a class, certain conditions must be assured to it under which it can at least continue its slavish existence. The serf, in the period of serfdom raised himself to membership in the commune, just as the petty bourgeois, under the yoke of feudal absolutism,

managed to develop into a bourgeois. The modern labourer, on the contrary, instead of rising with the progress of industry, sinks deeper and deeper below the conditions of existence of his own class. He becomes a pauper, and pauperism develops more rapidly than population and wealth. And here it becomes evident that the bourgeoisie is unfit any longer to be the ruling class in society, and to impose its conditions of existence upon society as an over-riding law. It is unfit to rule, because it is incompetent to assure an existence to its slave within his slavery, because it cannot help letting him sink into such a state that it has to feed him, instead of being fed by him. Society can no longer live under this bourgeoisie; in other words, its existence is no longer compatible with society.

The essential condition for the existence, and for the sway of the bourgeois class, is the formation and augmentation of capital; the condition for capital is wage-labour. Wage-labour rests exclusively on competition between the labourers. The advance of industry, whose involuntary promoter is the bourgeoisie, replaces the isolation of the labourers, due to competition, by their revolutionary combination, due to association. The development of modern industry, therefore, cuts from under its feet the very foundation on which the bourgeoisie produces and appropriates products. What the bourgeoisie therefore produces, above all, are its own grave-diggers. Its fall and the victory of the proletariat are equally inevitable.

— *The Communist Manifesto, I, 'Bourgeois and Proletarians'* (1848).

[CHARLES DARWIN ON THE ORIGIN OF SPECIES]

THAT many and serious objections may be advanced against the theory of descent with modification through natural selection, I do not deny. I have endeavoured to give to them their full force. Nothing at first can appear more difficult to believe than that the more complex organs and instincts should have been perfected, not by means superior to, though analogous with, human reason, but by the accumulation of innumerable slight variations, each good for the individual possessor. Nevertheless, this difficulty, though appearing to our imagination insuperably great, cannot be considered real if we admit the following propositions, namely, — that gradations in the perfection of any organ or instinct which we may consider, either do now exist or could have existed, each good of its kind, — that all organs and instincts are, in ever so slight a degree, variable, — and, lastly, that there is a struggle for existence leading to the preservation of each profitable deviation of structure or instinct. The truth of these propositions cannot, I think, be disputed.

It is, no doubt, extremely difficult even to conjecture by what gradations many structures have been perfected, more especially amongst broken and failing groups of organic beings; but we see so many strange gradations in nature, that we ought to be extremely cautious in saying that any organ or instinct, or any whole being, could not have arrived at its present state by many graduated steps. There are, it must be admitted, cases of special difficulty on the theory of natural selection; and one of the most curious of these is the existence of two or three defined castes of workers or sterile females in the same community of ants; but I have attempted to show how this difficulty can be mastered.

With respect to the almost universal sterility of species when first crossed, which forms so remarkable a contrast with the almost universal fertility of varieties when

crossed, I must refer the reader to the recapitulation of the facts given at the end of the eighth chapter, which seem to me conclusively to show that this sterility is no more a special endowment than is the incapacity of two trees to be grafted together; but that it is incidental on constitutional differences in the reproductive systems of the intercrossed species. We see the truth of this conclusion in the vast difference in the result, when the same two species are crossed reciprocally; that is, when one species is first used as the father and then as the mother.

The fertility of varieties when intercrossed and of their mongrel offspring cannot be considered as universal; nor is their very general fertility surprising when we remember that it is not likely that either their constitutions or their reproductive systems should have been profoundly modified. Moreover, most of the varieties which have been experimentised on have been produced under domestication; and as domestication (I do not mean mere confinement) apparently tends to eliminate sterility, we ought not to expect it also to produce sterility.

The sterility of hybrids is a very different case from that of first crosses, for their reproductive organs are more or less functionally impotent; whereas in first crosses the organs on both sides are in a perfect condition. As we continually see that organisms of all kinds are rendered in some degree sterile from their constitutions having been disturbed by slightly different and new conditions of life, we need not feel surprise at hybrids being in some degree sterile, for their constitutions can hardly fail to have been disturbed from being compounded of two distinct organisations. This parallelism is supported by another parallel, but directly opposite, class of facts; namely, that the vigour and fertility of all organic beings are increased by slight changes in their conditions of life, and that the offspring of slightly modified forms or varieties acquire from being crossed increased vigour and fertility. So that, on the one hand, considerable changes in the conditions of life and crosses between greatly modified forms, lessen fertility; and on the other, lesser changes in the conditions of life and crosses between less modified forms, increase fertility.

Turning to geographical distribution, the difficulties encountered on the theory of descent with modification are grave enough. All the individuals of the same species, and all the species of the same genus, or even higher group, must have descended from common parents; and therefore, in however distant and isolated parts of the world they are now found, they must in the course of successive generations have passed from some one part to the others. We are often wholly unable even to conjecture how this could have been effected. Yet, as we have reason to believe that some species have retained the same specific form for very long periods, enormously long as measured by years, too much stress ought not to be laid on the occasional wide diffusion of the same species; for during very long periods of time there will always have been a good chance for wide migration by many means. A broken or interrupted range may often be accounted for by the extinction of the species in the intermediate regions. It cannot be denied that we are as yet very ignorant of the full extent of the various climatal and geographical changes which have affected the earth during modern periods; and such changes will obviously have greatly facilitated migration. As an example, I have attempted to show how potent has been the influence of the Glacial period on the distribution both of the same and of representative species throughout the world. We are as yet profoundly ignorant of the many occasional means of transport. With respect to distinct species of the same genus inhabiting very distant and isolated regions, as the process of modification has necessarily been slow, all

the means of migration will have been possible during a very long period; and consequently the difficulty of the wide diffusion of species of the same genus is in some degree lessened.

As on the theory of natural selection an interminable number of intermediate forms must have existed, linking together all the species in each group by gradations as fine as our present varieties, it may be asked, Why do we not see these linking forms all around us? Why are not all organic beings blended together in an inextricable chaos? With respect to existing forms, we should remember that we have no right to expect (excepting in rare cases) to discover *directly* connecting links between them, but only between each and some extinct and supplanted form. Even on a wide area, which has during a long period remained continuous, and of which the climate and other conditions of life change insensibly in going from a district occupied by one species into another district occupied by a closely allied species, we have no just right to expect often to find intermediate varieties in the intermediate zone. For we have reason to believe that only a few species are undergoing change at any one period; and all changes are slowly effected. I have also shown that the intermediate varieties which will at first probably exist in the intermediate zones, will be liable to be supplanted by the allied forms on either hand; and the latter, from existing in greater numbers, will generally be modified and improved at a quicker rate than the intermediate varieties, which exist in lesser numbers; so that the intermediate varieties will, in the long run, be supplanted and exterminated.

On this doctrine of the extermination of an infinitude of connecting links, between the living and extinct inhabitants of the world, and at each successive period between the extinct and still older species, why is not every geological formation charged with such links? Why does not every collection of fossil remains afford plain evidence of the gradation and mutation of the forms of life? We meet with no such evidence, and this is the most obvious and forcible of the many objections which may be urged against my theory. Why, again, do whole groups of allied species appear, though certainly they often falsely appear, to have come in suddenly on the several geological stages? Why do we not find great piles of strata beneath the Silurian system, stored with the remains of the progenitors of the Silurian groups of fossils? For certainly on my theory such strata must somewhere have been deposited at these ancient and utterly unknown epochs in the world's history.

I can answer these questions and grave objections only on the supposition that the geological record is far more imperfect than most geologists believe. It cannot be objected that there has not been time sufficient for any amount of organic change; for the lapse of time has been so great as to be utterly inappreciable by the human intellect. The number of specimens in all our museums is absolutely as nothing compared with the countless generations of countless species which certainly have existed. We should not be able to recognise a species as the parent of any one or more species if we were to examine them ever so closely, unless we likewise possessed many of the intermediate links between their past or parent and present states; and these many links we could hardly ever expect to discover, owing to the imperfection of the geological record. Numerous existing doubtful forms could be named which are probably varieties; but who will pretend that in future ages so many fossil links will be discovered, that naturalists will be able to decide, on the common view, whether or not these doubtful forms are varieties? As long as most of the links between any two species are unknown, if any one link or intermediate variety be discovered, it will simply be classed as another and distinct

species. Only a small portion of the world has been geologically explored. Only organic beings of certain classes can be preserved in a fossil condition, at least in any great number. Widely ranging species vary most, and varieties are often at first local, — both causes rendering the discovery of intermediate links less likely. Local varieties will not spread into other and distant regions until they are considerably modified and improved; and when they do spread, if discovered in a geological formation, they will appear as if suddenly created there, and will be simply classed as new species. Most formations have been intermittent in their accumulation; and their duration, I am inclined to believe, has been shorter than the average duration of specific forms. Successive formations are separated from each other by enormous blank intervals of time; for fossiliferous formations, thick enough to resist future degradation, can be accumulated only where much sediment is deposited on the subsiding bed of the sea. During the alternate periods of elevation and of stationary level the record will be blank. During these latter periods there will probably be more variability in the forms of life; during periods of subsidence, more extinction.

With respect to the absence of fossiliferous formations beneath the lowest Silurian strata, I can only recur to the hypothesis given in the ninth chapter. That the geological record is imperfect all will admit; but that it is imperfect to the degree which I require, few will be inclined to admit. If we look to long enough intervals of time, geology plainly declares that all species have changed; and they have changed in the manner which my theory requires, for they have changed slowly and in a graduated manner. We clearly see this in the fossil remains from consecutive formations invariably being much more closely related to each other, than are the fossils from formations distant from each other in time.

Such is the sum of the several chief objections and difficulties which may justly be urged against my theory; and I have now briefly recapitulated the answers and explanations which can be given to them. I have felt these difficulties far too heavily during many years to doubt their weight. But it deserves especial notice that the more important objections relate to questions on which we are confessedly ignorant; nor do we know how ignorant we are. We do not know all the possible transitional gradations between the simplest and the most perfect organs; it cannot be pretended that we know all the varied means of Distribution during the long lapse of years, or that we know how imperfect the Geological Record is. Grave as these several difficulties are, in my judgment they do not overthrow the theory of descent from a few created forms with subsequent modification.

Now let us turn to the other side of the argument. Under domestication we see much variability. This seems to be mainly due to the reproductive system being eminently susceptible to changes in the conditions of life; so that this system, when not rendered impotent, fails to reproduce offspring exactly like the parent-form. Variability is governed by many complex laws, — by correlation of growth, by use and disuse, and by the direct action of the physical conditions of life. There is much difficulty in ascertaining how much modification our domestic productions have undergone; but we may safely infer that the amount has been large, and that modifications can be inherited for long periods. As long as the conditions of life remain the same, we have reason to believe that a modification, which has already been inherited for many generations, may continue to be inherited for an almost infinite number of generations. On the other hand we have evidence that variability, when it has once come into play, does not wholly cease; for new varieties are still occasion-

ally produced by our most anciently domesticated productions.

Man does not actually produce variability; he only unintentionally exposes organic beings to new conditions of life, and then nature acts on the organisation, and causes variability. But man can and does select the variations given to him by nature, and thus accumulate them in any desired manner. He thus adapts animals and plants for his own benefit or pleasure. He may do this methodically, or he may do it unconsciously by preserving the individuals most useful to him at the time, without any thought of altering the breed. It is certain that he can largely influence the character of a breed by selecting, in each successive generation, individual differences so slight as to be quite inappreciable by an uneducated eye. This process of selection has been the great agency in the production of the most distinct and useful domestic breeds. That many of the breeds produced by man have to a large extent the character of natural species, is shown by the inextricable doubts whether very many of them are varieties or aboriginal species.

There is no obvious reason why the principles which have acted so efficiently under domestication should not have acted under nature. In the preservation of favoured individuals and races, during the constantly-recurrent Struggle for Existence, we see the most powerful and ever-acting means of selection. The struggle for existence inevitably follows from the high geometrical ratio of increase which is common to all organic beings. This high rate of increase is proved by calculation, — by the rapid increase of many animals and plants during a succession of peculiar seasons, or when naturalised in a new country. More individuals are born than can possibly survive. A grain in the balance will determine which individual shall live and which shall die, — which variety or species shall increase in number, and which shall decrease, or finally become extinct. As the individuals of the same species come in all respects into the closest competition with each other, the struggle will generally be most severe between them; it will be almost equally severe between the varieties of the same species, and next in severity between the species of the same genus. But the struggle will often be very severe between beings most remote in the scale of nature. The slightest advantage in one being, at any age or during any season, over those with which it comes into competition, or better adaptation in however slight a degree to the surrounding physical conditions, will turn the balance.

With animals having separated sexes there will in most cases be a struggle between the males for possession of the females. The most vigorous individuals, or those which have most successfully struggled with their conditions of life, will generally leave most progeny. But success will often depend on having special weapons or means of defence, or on the charms of the males; and the slightest advantage will lead to victory.

As geology plainly proclaims that each land has undergone great physical changes, we might have expected that organic beings would have varied under nature, in the same way as they generally have varied under the changed conditions of domestication. And if there be any variability under nature, it would be an unaccountable fact if natural selection had not come into play. It has often been asserted, but the assertion is quite incapable of proof, that the amount of variation under nature is a strictly limited quantity. Man, though acting on external characters alone and often capriciously, can produce within a short period a great result by adding up mere individual differences in his domestic productions; and every one admits that there are at least individual differences in species under nature. But, besides such differences, all naturalists have admitted the existence of varieties, which they think

sufficiently distinct to be worthy of record in systematic works. No one can draw any clear distinction between individual differences and slight varieties; or between more plainly marked varieties and subspecies, and species. Let it be observed how naturalists differ in the rank which they assign to the many representative forms in Europe and North America.

If then we have under nature variability and a powerful agent always ready to act and select, why should we doubt that variations in any way useful to beings, under their excessively complex relations of life, would be preserved, accumulated, and inherited? Why, if man can by patience select variations most useful to himself, should nature fail in selecting variations useful, under changing conditions of life, to her living products? What limit can be put to this power, acting during long ages and rigidly scrutinising the whole constitution, structure, and habits of each creature, — favouring the good and rejecting the bad? I can see no limit to this power, in slowly and beautifully adapting each form to the most complex relations of life. The theory of natural selection, even if we looked no further than this, seems to me to be in itself probable. I have already recapitulated, as fairly as I could, the opposed difficulties and objections: now let us turn to the special facts and arguments in favour of the theory.

On the view that species are only strongly marked and permanent varieties, and that each species first existed as a variety, we can see why it is that no line of demarcation can be drawn between species, commonly supposed to have been produced by special acts of creation, and varieties which are acknowledged to have been produced by secondary laws. On this same view we can understand how it is that in each region where many species of a genus have been produced, and where they now flourish, these same species should present many varieties; for where the manufactory of species has been active, we might expect, as a general rule, to find it still in action; and this is the case if varieties be incipient species. Moreover, the species of the larger genera, which afford the greater number of varieties or incipient species, retain to a certain degree the character of varieties; for they differ from each other by a less amount of difference than do the species of smaller genera. The closely allied species also of the larger genera apparently have restricted ranges, and in their affinities they are clustered in little groups round other species — in which respects they resemble varieties. These are strange relations on the view of each species having been independently created, but are intelligible if all species first existed as varieties.

As each species tends by its geometrical ratio of reproduction to increase inordinately in number; and as the modified descendants of each species will be enabled to increase by so much the more as they become diversified in habits and structure, so as to be enabled to seize on many and widely different places in the economy of nature, there will be a constant tendency in natural selection to preserve the most divergent offspring of any one species. Hence during a long-continued course of modification, the slight differences, characteristic of varieties of the same species, tend to be augmented into the greater differences characteristic of species of the same genus. New and improved varieties will inevitably supplant and exterminate the older, less improved and intermediate varieties; and thus species are rendered to a large extent defined and distinct objects. Dominant species belonging to the larger groups tend to give birth to new and dominant forms; so that each large group tends to become still larger, and at the same time more divergent in character. But as all groups cannot thus succeed in increasing in size, for the world would not hold them, the more dominant groups beat the less dominant. This tendency in the large

groups to go on increasing in size and diverging in character, together with the almost inevitable contingency of much extinction, explains the arrangement of all the forms of life, in groups subordinate to groups, all within a few great classes, which we now see everywhere around us, and which has prevailed throughout all time. This grand fact of the grouping of all organic beings seems to me utterly inexplicable on the theory of creation.

As natural selection acts sólely by accumulating slight, successive, favourable variations, it can produce no great or sudden modification; it can act only by very short and slow steps. Hence the canon of 'Natura non facit saltum,' which every fresh addition to our knowledge tends to make truer, is on this theory simply intelligible. We can plainly see why nature is prodigal in variety, though niggard in innovation. But why this should be a law of nature if each species has been independently created, no man can explain.

Many other facts are, as it seems to me, explicable on this theory. How strange it is that a bird, under the form of woodpecker, should have been created to prey on insects on the ground; that upland geese, which never or rarely swim, should have been created with webbed feet; that a thrush should have been created to dive and feed on the sub-aquatic insects; and that a petrel should have been created with habits and structure fitting it for the life of an auk or grebe! and so on in endless other cases. But on the view of each species constantly trying to increase in number, with natural selection always ready to adapt the slowly varying descendants of each to any unoccupied or ill-occupied place in nature, these facts cease to be strange, or perhaps might even have been anticipated.

As natural selection acts by competition, it adapts the inhabitants of each country only in relation to the degree of perfection of their associates; so that we need feel no surprise at the inhabitants of any one country, although on the ordinary view supposed to have been specially created and adapted for that country, being beaten and supplanted by the naturalised productions from another land. Nor ought we to marvel if all the contrivances in nature be not, as far as we can judge, absolutely perfect; and if some of them be abhorrent to our ideas of fitness. We need not marvel at the sting of the bee causing the bee's own death; at drones being produced in such vast numbers for one single act, with the great majority slaughtered by their sterile sisters; at the astonishing waste of pollen by our fir-trees; at the instinctive hatred of the queen bee for her own fertile daughters; at ichneumonidæ feeding within the live bodies of caterpillars; and at other such cases. The wonder indeed is, on the theory of natural selection, that more cases of the want of absolute perfection have not been observed.

The complex and little known laws governing variation are the same, as far as we can see, with the laws which have governed the production of so-called specific forms. In both cases physical conditions seem to have produced but little direct effect; yet when varieties enter any zone, they occasionally assume some of the characters of the species proper to that zone. In both varieties and species, use and disuse seem to have produced some effect; for it is difficult to resist this conclusion when we look, for instance, at the logger-headed duck, which has wings incapable of flight, in nearly the same condition as in the domestic duck; or when we look at the burrowing tucutucu, which is occasionally blind, and then at certain moles, which are habitually blind and have their eyes covered with skin; or when we look at the blind animals inhabiting the dark caves of America and Europe. In both varieties and species correlation of growth seems to have played a most important part, so that when one part has been modified other parts are necessarily modified. In both varieties and

species reversions to long-lost characters occur. How inexplicable on the theory of creation is the occasional appearance of stripes on the shoulder and legs of the several species of the horse-genus and in their hybrids! How simply is this fact explained if we believe that these species have descended from a striped progenitor, in the same manner as the several domestic breeds of pigeon have descended from the blue and barred rock-pigeon!

On the ordinary view of each species having been independently created, why should the specific characters, or those by which the species of the same genus differ from each other, be more variable than the generic characters in which they all agree? Why, for instance, should the colour of a flower be more likely to vary in any one species of a genus, if the other species, supposed to have been created independently, have differently coloured flowers, than if all the species of the genus have the same coloured flowers? If species are only well-marked varieties, of which the characters have become in a high degree permanent, we can understand this fact; for they have already varied since they branched off from a common progenitor in certain characters, by which they have come to be specifically distinct from each other; and therefore these same characters would be more likely still to be variable than the generic characters which have been inherited without change for an enormous period. It is inexplicable on the theory of creation why a part developed in a very unusual manner in any one species of a genus, and therefore, as we may naturally infer, of great importance to the species, should be eminently liable to variation; but, on my view, this part has undergone, since the several species branched off from a common progenitor, an unusual amount of variability and modification, and therefore we might expect this part generally to be still variable. But a part may be developed in the most unusual manner, like the wing of a bat, and yet not be more variable than any other structure, if the part be common to many subordinate forms, that is, if it has been inherited for a very long period; for in this case it will have been rendered constant by long-continued natural selection.

Glancing at instincts, marvellous as some are, they offer no greater difficulty than does corporeal structure on the theory of the natural selection of successive, slight, but profitable modifications. We can thus understand why nature moves by graduated steps in endowing different animals of the same class with their several instincts. I have attempted to show how much light the principle of gradation throws on the admirable architectural powers of the hive-bee. Habit no doubt sometimes comes into play in modifying instincts; but it certainly is not indispensable, as we see, in the case of neuter insects, which leave no progeny to inherit the effects of long-continued habit. On the view of all the species of the same genus having descended from a common parent, and having inherited much in common, we can understand how it is that allied species, when placed under considerably different conditions of life, yet should follow nearly the same instincts; why the thrush of South America, for instance, lines her nest with mud like our British species. On the view of instincts having been slowly acquired through natural selection we need not marvel at some instincts being apparently not perfect and liable to mistakes, and at many instincts causing other animals to suffer.

If species be only well-marked and permanent varieties, we can at once see why their crossed offspring should follow the same complex laws in their degrees and kinds of resemblance to their parents, — in being absorbed into each other by successive crosses, and in other such points, — as do the crossed offspring of acknowledged varieties. On the other hand, these would be strange facts if species have been independently created, and varieties have been produced by secondary laws.

If we admit that the geological record is imperfect in an extreme degree, then such facts as the record gives, support the theory of descent with modification. New species have come on the stage slowly and at successive intervals; and the amount of change, after equal intervals of time, is widely different in different groups. The extinction of species and of whole groups of species, which has played so conspicuous a part in the history of the organic world, almost inevitably follows on the principle of natural selection; for old forms will be supplanted by new and improved forms. Neither single species nor groups of species reappear when the chain of ordinary generation has once been broken. The gradual diffusion of dominant forms, with the slow modification of their descendants, causes the forms of life, after long intervals of time, to appear as if they had changed simultaneously throughout the world. The fact of the fossil remains of each formation being in some degree intermediate in character between the fossils in the formations above and below, is simply explained by their intermediate position in the chain of descent. The grand fact that all extinct organic beings belong to the same system with recent beings, falling either into the same or into intermediate groups, follows from the living and the extinct being the offspring of common parents. As the groups which have descended from an ancient progenitor have generally diverged in character, the progenitor with its early descendants will often be intermediate in character in comparison with its later descendants; and thus we can see why the more ancient a fossil is, the oftener it stands in some degree intermediate between existing and allied groups. Recent forms are generally looked at as being, in some vague sense, higher than ancient and extinct forms; and they are in so far higher as the later and more improved forms have conquered the older and less improved organic beings in the struggle for life. Lastly, the law of the long endurance of allied forms on the same continent, — of marsupials in Australia, of edentata in America, and other such cases, — is intelligible, for within a confined country, the recent and the extinct will naturally be allied by descent.

Looking to geographical distribution, if we admit that there has been during the long course of ages much migration from one part of the world to another, owing to former climatal and geographical changes and to the many occasional and unknown means of dispersal, then we can understand, on the theory of descent with modification, most of the great leading facts in Distribution. We can see why there should be so striking a parallelism in the distribution of organic beings throughout space, and in their geological succession through out time; for in both cases the beings have been connected by the bond of ordinary generation, and the means of modification have been the same. We see the full meaning of the wonderful fact, which must have struck every traveller, namely, that on the same continent, under the most diverse conditions, under heat and cold, on mountain and lowland, on deserts and marshes, most of the inhabitants within each great class are plainly related; for they will generally be descendants of the same progenitors and early colonists. On this same principle of former migration, combined in most cases with modification, we can understand, by the aid of the Glacial period, the identity of some few plants, and the close alliance of many others, on the most distant mountains, under the most different climates; and likewise the close alliance of some of the inhabitants of the sea in the northern and southern temperate zones, though separated by the whole intertropical ocean. Although two areas may present the same physical conditions of life, we need feel no surprise at their inhabitants being widely different, if they have been for a long period completely separated from each other; for as the relation of organism to organism is the most important

of all relations, and as the two areas will have received colonists from some third source or from each other, at various periods and in different proportions, the course of modification in the two areas will inevitably be different.

On this view of migration, with subsequent modification, we can see why oceanic islands should be inhabited by few species, but of these, that many should be peculiar. We can clearly see why those animals which cannot cross wide spaces of ocean, as frogs and terrestrial mammals, should not inhabit oceanic islands; and why, on the other hand, new and peculiar species of bats, which can traverse the ocean, should so often be found on islands far distant from any continent. Such facts as the presence of peculiar species of bats, and the absence of all other mammals, on oceanic islands, are utterly inexplicable on the theory of independent acts of creation.

The existence of closely allied or representative species in any two areas, implies, on the theory of descent with modification, that the same parents formerly inhabited both areas; and we almost invariably find that wherever many closely allied species inhabit two areas, some identical species common to both still exist. Wherever many closely allied yet distinct species occur, many doubtful forms and varieties of the same species likewise occur. It is a rule of high generality that the inhabitants of each area are related to the inhabitants of the nearest source whence immigrants might have been derived. We see this in nearly all the plants and animals of the Galapagos Archipelago, of Juan Fernandez, and of the other American islands being related in the most striking manner to the plants and animals of the neighbouring American mainland; and those of the Cape de Verde Archipelago and other African islands to the African mainland. It must be admitted that these facts receive no explanation on the theory of creation.

The fact, as we have seen, that all past and present organic beings constitute one grand natural system, with group subordinate to group, and with extinct groups often falling in between recent groups, is intelligible on the theory of natural selection with its contingencies of extinction and divergence of character. On these same principles we see how it is, that the mutual affinities of the species and genera within each class are so complex and circuitous. We see why certain characters are far more serviceable than others for classification; — why adaptive characters, though of paramount importance to the being, are of hardly any importance in classification; why characters derived from rudimentary parts, though of no service to the being, are often of high classificatory value; and why embryological characters are the most valuable of all. The real affinities of all organic beings are due to inheritance or community of descent. The natural system is a genealogical arrangement, in which we have to discover the lines of descent by the most permanent characters, however slight their vital importance may be.

The framework of bones being the same in the hand of a man, wing of a bat, fin of the porpoise, and leg of the horse, — the same number of vertebræ forming the neck of the giraffe and of the elephant, — and innumerable other such facts, at once explain themselves on the theory of descent with slow and slight successive modifications. The similarity of pattern in the wing and leg of a bat, though used for such different purpose, — in the jaws and legs of a crab, — in the petals, stamens, and pistils of a flower, is likewise intelligible on the view of the gradual modification of parts or organs, which were alike in the early progenitor of each class. On the principle of successive variations not always supervening at an early age, and being inherited at a corresponding not early period of life, we can clearly see why the embryos of mammals, birds, reptiles, and fishes should be so closely alike, and should be so unlike the adult forms. We may cease marvelling at the embryo of an air-breathing mammal

or bird having branchial slits and arteries running in loops, like those in a fish which has to breathe the air dissolved in water, by the aid of well-developed branchiæ.

Disuse, aided sometimes by natural selection, will often tend to reduce an organ, when it has become useless by changed habits or under changed conditions of life; and we can clearly understand on this view the meaning of rudimentary organs. But disuse and selection will generally act on each creature, when it has come to maturity and has to play its full part in the struggle for existence, and will thus have little power of acting on an organ during early life; hence the organ will not be much reduced or rendered rudimentary at this early age. The calf, for instance, has inherited teeth, which never cut through the gums of the upper jaw, from an early progenitor having well-developed teeth; and we may believe, that the teeth in the mature animal were reduced, during successive generations, by disuse or by the tongue and palate having been better fitted by natural selection to browse without their aid; whereas in the calf, the teeth have been left untouched by selection or disuse, and on the principle of inheritance at corresponding ages have been inherited from a remote period to the present day. On the view of each organic being and each separate organ having been specially created, how utterly inexplicable it is that parts, like the teeth in the embryonic calf or like the shrivelled wings under the soldered wing-covers of some beetles, should thus so frequently bear the plain stamp of inutility! Nature may be said to have taken pains to reveal, by rudimentary organs and by homologous structure, her scheme of modification, which it seems that we wilfully will not understand.

I have now recapitulated the chief facts and considerations which have thoroughly convinced me that species have been modified, during a long course of descent, by the preservation or the natural selection of many successive slight favourable variations. I cannot believe that a false theory would explain, as it seems to me that the theory of natural selection does explain, the several large classes of facts above specified. I see no good reason why the views given in this volume should shock the religious feelings of any one. A celebrated author and divine has written to me that 'he has gradually learnt to see that it is just as noble a conception of the Deity to believe that He created a few original forms capable of self-development into other and needful forms, as to believe that He required a fresh act of creation to supply the voids caused by the action of His laws.'

Why, it may be asked, have all the most eminent living naturalists and geologists rejected this view of the mutability of species? It cannot be asserted that organic beings in a state of nature are subject to no variation; it cannot be proved that the amount of variation in the course of long ages is a limited quantity; no clear distinction has been, or can be, drawn between species and well-marked varieties. It cannot be maintained that species when intercrossed are invariably sterile, and varieties invariably fertile; or that sterility is a special endowment and sign of creation. The belief that species were immutable productions was almost unavoidable as long as the history of the world was thought to be of short duration; and now that we have acquired some idea of the lapse of time, we are too apt to assume, without proof, that the geological record is so perfect that it would have afforded us plain evidence of the mutation of species, if they had undergone mutation.

But the chief cause of our natural unwillingness to admit that one species has given birth to other and distinct species, is that we are always slow in admitting any great change of which we do not see the intermediate steps. The difficulty is the same as that felt by so many geologists, when Lyell first insisted that long lines of

inland cliffs had been formed, and great valleys excavated, by the slow action of the coast-waves. The mind cannot possibly grasp the full meaning of the term of a hundred million years; it cannot add up and perceive the full effects of many slight variations, accumulated during an almost infinite number of generations.

Although I am fully convinced of the truth of the views given in this volume under the form of an abstract, I by no means expect to convince experienced naturalists whose minds are stocked with a multitude of facts all viewed, during a long course of years, from a point of view directly opposite to mine. It is so easy to hide our ignorance under such expressions as the 'plan of creation,' 'unity of design,' etc., and to think that we give an explanation when we only restate a fact. Any one whose disposition leads him to attach more weight to unexplained difficulties than to the explanation of a certain number of facts will certainly reject my theory. A few naturalists, endowed with much flexibility of mind, and who have already begun to doubt on the immutability of species, may be influenced by this volume; but I look with confidence to the future, to young and rising naturalists, who will be able to view both sides of the question with impartiality. Whoever is led to believe that species are mutable will do good service by conscientiously expressing his conviction; for only thus can the load of prejudice by which this subject is overwhelmed be removed.

Several eminent naturalists have of late published their belief that a multitude of reputed species in each genus are not real species; but that other species are real, that is, have been independently created. This seems to me a strange conclusion to arrive at. They admit that a multitude of forms, which till lately they themselves thought were special creations, and which are still thus looked at by the majority of naturalists, and which consequently have every external characteristic feature of true species, — they admit that these have been produced by variation, but they refuse to extend the same view to other and very slightly different forms. Nevertheless they do not pretend that they can define, or even conjecture, which are the created forms of life, and which are those produced by secondary laws. They admit variation as a *vera causa* in one case, they arbitrarily reject it in another, without assigning any distinction in the two cases. The day will come when this will be given as a curious illustration of the blindness of preconceived opinion. These authors seem no more startled at a miraculous act of creation than at an ordinary birth. But do they really believe that at innumerable periods in the earth's history certain elemental atoms have been commanded suddenly to flash into living tissues? Do they believe that at each supposed act of creation one individual or many were produced? Were all the infinitely numerous kinds of animals and plants created as eggs or seed, or as full grown? and in the case of mammals, were they created bearing the false marks of nourishment from the mother's womb? Although naturalists very properly demand a full explanation of every difficulty from those who believe in the mutability of species, on their own side they ignore the whole subject of the first appearance of species in what they consider reverent silence.

It may be asked how far I extend the doctrine of the modification of species. The question is difficult to answer, because the more distinct the forms are which we may consider, by so much the arguments fall away in force. But some arguments of the greatest weight extend very far. All the members of whole classes can be connected together by chains of affinities, and all can be classified on the same principle, in groups subordinate to groups. Fossil remains sometimes tend to fill up very wide intervals between existing orders. Organs in a rudimentary condition plainly show that an early progenitor had

the organ in a fully developed state; and this in some instances necessarily implies an enormous amount of modification in the descendants. Throughout whole classes various structures are formed on the same pattern, and at an embryonic age the species closely resemble each other. Therefore I cannot doubt that the theory of descent with modification embraces all the members of the same class. I believe that animals have descended from at most only four or five progenitors, and plants from an equal or lesser number.

Analogy would lead me one step further, namely, to the belief that all animals and plants have descended from some one prototype. But analogy may be a deceitful guide. Nevertheless all living things have much in common, in their chemical composition, their germinal vesicles, their cellular structure, and their laws of growth and reproduction. We see this even in so trifling a circumstance as that the same poison often similarly affects plants and animals; or that the poison secreted by the gall-fly produces monstrous growths on the wild rose or oak-tree. Therefore I should infer from analogy that probably all the organic beings which have ever lived on this earth have descended from some one primordial form, into which life was first breathed by the Creator.

When the views advanced by me in this volume, and by Mr. Wallace in the *Linnean Journal,* or when analogous views on the origin of species are generally admitted, we can dimly foresee that there will be a considerable revolution in natural history. Systematists will be able to pursue their labours as at present; but they will not be incessantly haunted by the shadowy doubt whether this or that form be in essence a species. This I feel sure, and I speak after experience, will be no slight relief. The endless disputes whether or not some fifty species of British brambles are true species will cease. Systematists will have only to decide (not that this will be easy) whether any form be sufficiently constant and distinct from other forms, to be capable of definition; and if definable, whether the differences be sufficiently important to deserve a specific name. This latter point will become a far more essential consideration than it is at present; for differences, however slight, between any two forms, if not blended by intermediate gradations, are looked at by most naturalists as sufficient to raise both forms to the rank of species. Hereafter we shall be compelled to acknowledge that the only distinction between species and well-marked varieties is, that the latter are known, or believed, to be connected at the present day by intermediate gradations, whereas species were formerly thus connected. Hence, without rejecting the consideration of the present existence of intermediate gradations between any two forms, we shall be led to weigh more carefully and to value higher the actual amount of difference between them. It is quite possible that forms now generally acknowledged to be merely varieties may hereafter be thought worthy of specific names, as with the primrose and cowslip; and in this case scientific and common language will come into accordance. In short, we shall have to treat species in the same manner as those naturalists treat genera, who admit that genera are merely artificial combinations made for convenience. This may not be a cheering prospect; but we shall at least be freed from the vain search for the undiscovered and undiscoverable essence of the term species.

The other and more general departments of natural history will rise greatly in interest. The terms used by naturalists of affinity, relationship, community of type, paternity, morphology, adaptive characters, rudimentary and aborted organs, etc., will cease to be metaphorical, and will have a plain signification. When we no longer look at an organic being as a savage looks at a ship, as at something wholly beyond his comprehension; when we regard every

production of nature as one which has had a history; when we contemplate every complex structure and instinct as the summing up of many contrivances, each useful to the possessor, nearly in the same way as when we look at any great mechanical invention as the summing up of the labour, the experience, the reason, and even the blunders of numerous workmen; when we thus view each organic being, how far more interesting, I speak from experience, will the study of natural history become!

A grand and almost untrodden field of inquiry will be opened, on the causes and laws of variation, on correlation of growth, on the effects of use and disuse, on the direct action of external conditions, and so forth. The study of domestic productions will rise immensely in value. A new variety raised by man will be a more important and interesting subject for study than one more species added to the infinitude of already recorded species. Our classifications will come to be, as far as they can be so made, genealogies; and will then truly give what may be called the plan of creation. The rules for classifying will no doubt become simpler when we have a definite object in view. We possess no pedigrees or armorial bearings; and we have to discover and trace the many diverging lines of descent in our natural genealogies, by characters of any kind which have long been inherited. Rudimentary organs will speak infallibly with respect to the nature of long-lost structures. Species and groups of species, which are called aberrant, and which may fancifully be called living fossils, will aid us in forming a picture of the ancient forms of life. Embryology will reveal to us the structure, in some degree obscured, of the prototypes of each great class.

When we can feel assured that all the individuals of the same species, and all the closely allied species of most genera, have within a not very remote period descended from one parent, and have migrated from some one birthplace; and when we better know the many means of migration, then, by the light which geology now throws, and will continue to throw, on former changes of climate and of the level of the land, we shall surely be enabled to trace in an admirable manner the former migrations of the inhabitants of the whole world. Even at present, by comparing the differences of the inhabitants of the sea on the opposite sides of a continent, and the nature of the various inhabitants of that continent in relation to their apparent means of immigration, some light can be thrown on ancient geography.

The noble science of Geology loses glory from the extreme imperfection of the record. The crust of the earth with its embedded remains must not be looked at as a well-filled museum, but as a poor collection made at hazard and at rare intervals. The accumulation of each great fossiliferous formation will be recognised as having depended on an unusual concurrence of circumstances, and the blank intervals between the successive stages as having been of vast duration. But we shall be able to gauge with some security the duration of these intervals by a comparison of the preceding and succeeding organic forms. We must be cautious in attempting to correlate as strictly contemporaneous two formations, which include few identical species, by the general succession of their forms of life. As species are produced and exterminated by slowly acting and still existing causes, and not by miraculous acts of creation and by catastrophes; and as the most important of all causes of organic change is one which is almost independent of altered and perhaps suddenly altered physical conditions, namely, the mutual relation of organism to organism, — the improvement of one being entailing the improvement or the extermination of others; it follows, that the amount of organic change in the fossils of consecutive formations probably serves as a fair measure of the lapse

of actual time. A number of species, however, keeping in a body might remain for a long period unchanged, whilst within this same period, several of these species, by migrating into new countries and coming into competition with foreign associates, might become modified; so that we must not overrate the accuracy of organic change as a measure of time. During early periods of the earth's history, when the forms of life were probably fewer and simpler, the rate of change was probably slower; and at the first dawn of life, when very few forms of the simplest structure existed, the rate of change may have been slow in an extreme degree. The whole history of the world, as at present known, although of a length quite incomprehensible by us, will hereafter be recognised as a mere fragment of time, compared with the ages which have elapsed since the first creature, the progenitor of innumerable extinct and living descendants, was created.

In the distant future I see open fields for far more important researches. Psychology will be based on a new foundation, that of the necessary acquirement of each mental power and capacity by gradation. Light will be thrown on the origin of man and his history.

Authors of the highest eminence seem to be fully satisfied with the view that each species has been independently created. To my mind it accords better with what we know of the laws impressed on matter by the Creator, that the production and extinction of the past and present inhabitants of the world should have been due to secondary causes, like those determining the birth and death of the individual. When I view all beings not as special creations, but as the lineal descendants of some few beings which lived long before the first bed of the Silurian system was deposited, they seem to me to become ennobled. Judging from the past, we may safely infer that not one living species will transmit its unaltered likeness to a distant futurity. And of the species now living very few will transmit progeny of any kind to a far distant futurity; for the manner in which all organic beings are grouped, shows that the greater number of species of each genus, and all the species of many genera, have left no descendants, but have become utterly extinct. We can so far take a prophetic glance into futurity as to foretell that it will be the common and widely-spread species, belonging to the larger and dominant groups, which will ultimately prevail and procreate new and dominant species. As all the living forms of life are the lineal descendants of those which lived long before the Silurian epoch, we may feel certain that the ordinary succession by generation has never once been broken, and that no cataclysm has desolated the whole world. Hence we may look with some confidence to a secure future of equally inappreciable length. And as natural selection works solely by and for the good of each being, all corporeal and mental endowments will tend to progress towards perfection.

It is interesting to contemplate an entangled bank, clothed with many plants of many kinds, with birds singing on the bushes, with various insects flitting about, and with worms crawling through the damp earth, and to reflect that these elaborately constructed forms, so different from each other, and dependent on each other in so complex a manner, have all been produced by laws acting around us. These laws, taken in the largest sense, being Growth with Reproduction; Inheritance, which is almost implied by reproduction; Variability, from the indirect and direct action of the external conditions of life, and from use and disuse; a Ratio of Increase so high as to lead to a Struggle for Life, and as a consequence to Natural Selection, entailing Divergence of Character and the Extinction of less-improved forms. Thus, from the war of nature, from famine and death, the most exalted object which we

are capable of conceiving, namely, the production of the higher animals, directly follows. There is grandeur in this view of life, with its several powers, having been originally breathed by the Creator into a few forms or into one; and that, whilst this planet has gone cycling on according to the fixed law of gravity, from so simple a beginning endless forms most beautiful and most wonderful have been, and are being, evolved.

— CHARLES DARWIN,
The Origin of Species
Chap. XIV. Recapitulation and Conclusion.
(1859).

[HERBERT SPENCER ON EVOLUTION]

The Law of Evolution

115. Evolution, then, under its primary aspect, is a change from a less coherent form to a more coherent form, consequent on the dissipation of motion and integration of matter. This is the universal process through which sensible existences, individually and as a whole, pass during the ascending halves of their histories. This proves to be a character displayed in those earliest changes which the visible Universe is supposed to have undergone, and in those latest changes which we trace in societies and the products of social life. And, throughout, the unification proceeds in several ways simultaneously.

* * *

[Ch.XV.] 116. Changes great in their amounts and various in their kinds, which accompany those dealt with in the last chapter, have thus far been ignored; or, if tacitly recognised, have not been avowedly recognised. Integration of each whole has been described as taking place simultaneously with integration of each of the parts into which it divides itself. But how comes the whole to divide itself into parts? This is a transformation more remarkable than the passage of the whole from an incoherent to a coherent state; and a formula which says nothing about it omits more than half the phenomena to be formulated.

This larger half of the phenomena we have now to treat. Here we are concerned with those secondary re-distributions of matter and motion which go on along with the primary re-distribution. We saw that while in very incoherent aggregates, secondary re-distributions produce but evanescent results, in aggregates that reach and maintain a certain medium state, neither very incoherent nor very coherent, results of a relatively persistent kind are produced — structural modifications. And our next inquiry must be — What is the universal expression for these structural modifications?

Already an implied answer has been given by the title — Compound Evolution. Already in distinguishing as simple Evolution, that integration of matter and dissipation of motion which is unaccompanied by secondary re-distributions, it has been tacitly asserted that where secondary re-distributions occur complexity arises: the mass, instead of remaining uniform, must have become multiform. The proposition is an identical one. To say that along with the primary re-distribution there go secondary re-distributions, is to say that along with the change from a diffused to a concentrated state, there goes a change from a homogeneous state to a heterogeneous state. The components of the mass while becoming integrated have also become differentiated. . . .

121. Advance from the homogeneous to the heterogeneous is clearly displayed in the progress of the latest and most heterogeneous creature — Man. While the peopling of the Earth has been going on, the human organism has grown more heterogeneous among the civilised divisions of

the species; and the species, as a whole, has been made more heterogeneous by the multiplication of races and the differentiation of them from one another. In proof of the first of these statements may be cited the fact that, in the relative development of the limbs, civilised men depart more widely from the general type of the placental mammalia, than do the lowest men. Though often possessing well-developed body and arms, the Papuan has very small legs; thus reminding us of the man-like apes, in which there is no great contrast in size between the hind and fore limbs. But in the European, the greater length and massiveness of the legs has become marked — the fore and hind limbs are relatively more heterogeneous. The greater ratio which the cranial bones bear to the facial bones, illustrates the same truth. Among the *Vertebrata* in general, evolution is marked by an increasing heterogeneity in the vertebral column, and especially in the components of the skull: the higher forms being distinguished by the relatively larger size of the bones which cover the brain, and the relatively smaller size of those which form the jaws, &c. Now this trait, which is stronger in Man than in any other creature, is stronger in the European than in the savage. Moreover, from the greater extent and variety of faculty he exhibits, we may infer that the civilised man has also a more complex or heterogeneous nervous system than the uncivilised man; and, indeed, the fact is in part visible in the increased ratio which his cerebrum bears to the subjacent ganglia.

126. Many further illustrations of the general law throughout social products might be detailed. Going back to the time when the deeds of the god-king, chanted and mimetically represented in dances before his altar, were further narrated in picture-writings on the walls of temples and palaces, and so constituted a rude history, we might trace the development of Literature through phases in which, as in the Hebrew Scriptures, it presents in one work, theology, cosmogony, history, biography, civil law, ethics, poetry; through other phases in which, as in the Iliad, the religious, martial, historical, the epic, dramatic, and lyric elements are similarly commingled; down to its present heterogeneous development, in which its divisions and subdivisions are so numerous and varied as to defy complete classification. Or we might track the untolding of Science; beginning with the era in which it was not yet differentiated from Art, and was, in union with Art, the handmaid of Religion; passing through the era in which the sciences were so few and rudimentary, as to be simultaneously cultivated by the same philosophers; and ending with the era in which the genera and species are so multitudinous that few can enumerate them, and no one can adequately grasp even one genus. Or we might do the like with Architecture, with the Drama, with Dress. But doubtless the reader is already weary of illustrations, and my promise has been amply fulfilled. The advance from the simple to the complex, through successive modifications upon modifications, is seen alike in the earliest changes of the Heavens to which we can reason our way back, and in the earliest changes we can inductively establish; it is seen in the geologic and climatic evolution of the Earth, of every individual organism on its surface and in the aggregate of organisms; it is seen in the evolution of Humanity, whether contemplated in the civilised man, or in the assemblage of races; it is seen in the evolution of Society, in respect alike of its political, its religious, and its economical organisation; and it is seen in the evolution of those countless concrete and abstract products of human activity, which constitute the environment of our daily life. From the remotest past which Science can fathom, up to the novelties of yesterday, an essential trait of Evolution has been the transformation of the homogeneous into the heterogeneous. . . .

[Ch.XVI.] 129. At the same time that Evolution is a change from the homogeneous to the heterogeneous, it is a change from the indefinite to the definite. Along with an advance from simplicity to complexity, there is an advance from confusion to order — from undetermined arrangement to determined arrangement. Development, no matter of what kind, exhibits not only a multiplication of unlike parts, but an increase in the clearness with which these parts are marked off from one another. And this is the distinction sought. . . .

If advance from the indefinite to the definite is an essential characteristic of Evolution, we shall of course find it everywhere displayed; as in the last chapter we found displayed the advance from the homogeneous to the heterogeneous. . . .

[Ch.XVII.] 139. The conception of Evolution elaborated in the foregoing chapters, is still incomplete. True though it is, it is not the whole truth. The transformations which all things undergo during the ascending phases of their existence, we have contemplated under three aspects; and by uniting these three aspects as simultaneously presented, we have formed an approximate idea of the transformations. But there are concomitant changes about which nothing has yet been said, and which, though less conspicuous, are no less essential.

For thus far we have attended only to the re-distribution of Matter, neglecting the accompanying re-distribution of Motion. Distinct or tacit reference has, indeed, repeatedly been made to the dissipation of Motion, that goes along with the concentration of Matter; and were all Evolution absolutely simple, the total fact would be contained in the proposition that as Motion dissipates Matter concentrates. But while we have recognized the *ultimate* re-distribution of the Motion, we have passed over its *proximate* re-distribution. Though something has from time to time been said about the escaping motion, nothing has been said about the motion which does not escape. In proportion as Evolution becomes compound — in proportion as an aggregate retains, for a considerable time, such quantity of motion as permits secondary re-distributions of its component matter, there necessarily arise secondary re-distributions of its retained motion. As fast as the parts are transformed, there goes on a transformation of the sensible or insensible motions possessed by the parts. They cannot become more integrated, either individually or as a combination, without their motions, individual or combined, becoming more integrated. There cannot arise among them heterogeneities of size, of form, of quality, without there also arising heterogeneities in the amounts and directions of their motions, or the motions of their molecules. And increasing definiteness of the parts implies increasing definiteness of their motions. In short, the rhythmical actions going on in each aggregate, must differentiate and integrate at the same time that the structures do so.

139a. The general theory of the re-distribution of the retained motion, must here be briefly stated. Properly to supplement our conception of Evolution under its material aspect by a conception of Evolution under its dynamical aspect, we have to recognise the source of the integrated motions that arise, and to see how their increased multiformity and definiteness are necessitated.

If Evolution is a passage from a diffused state to an aggregated state, then the motions of the celestial bodies must have resulted from the uncancelled motions of their once dispersed components. Along with the molecular motions everywhere active, there were molar motions of those vast streams of nebulous matter which were generated during the process of concentration — molar motions of which large portions were gradually dissipated as heat, leaving undissipated portions. But since the molar motions of these nebulous streams were constituted from the motions

of multitudinous incoherent gaseous parts severally moving more or less independently, it follows that when aggregation into a liquid and finally solid celestial mass was reached, these partially independent motions of the incoherent parts became merged into the motion of the whole; or, in other words, unintegrated motions became an integrated motion. While we must leave in the shape of hypothesis the belief that the celestial motions have thus originated, we may see, as a matter of fact, that the integration of insensible motions originates all sensible motions on the Earth's surface. As all know, the denudation of lands and deposit of new strata, are effected by water while descending to the sea, or during the arrest of those undulations produced on it by winds; and, as before said, the elevation of water to the height whence it fell, is due to solar heat, as is also the genesis of those aerial currents which drift it about when evaporated and agitate its surface when condensed. That is to say, the molecular motion of the ethereal medium is transformed into the motion of gases, thence into the motions of liquids, and thence into the motion of solids: stages in each of which a certain amount of molecular motion is lost and an equivalent motion of masses gained. It is the same with organic movements. Certain rays issuing from the Sun, enable the plant to reduce special elements existing in gaseous combinations around it, to solid forms — enable the plant, that is, to grow and carry on its functional changes. And since growth, equally with circulation of sap, is a mode of sensible motion, while those rays which have been expended in generating both consist of insensible motions, we have here, too, a transformation of the kind alleged. Animals, derived as their forces are, directly or indirectly, from plants, carry this transformation a step further. The automatic movements of the viscera, together with the voluntary movements of the limbs and body at large, arise at the expense of certain molecular movements throughout the nervous and muscular tissues; and these originally arose at the expense of certain other molecular movements propagated by the Sun to the Earth; so that both the structural and functional motions which organic Evolution displays, are motions of aggregates generated by the arrested motions of units. Even with the aggregates of these aggregates the same rule holds. For among associated men the progress is ever towards a merging of individual actions in the actions of corporate bodies. In militant life this is seen in the advance from the independent fighting of separate warriors to the combined fighting of regiments, and in industrial life in the advance from the activities of separate workers to the combined activities of factory hands. So is it, too, when instead of acting alone citizens act in bodies — companies, unions, associations, &c. While, then, during Evolution the escaping motion becomes, by widening dispersion, more disintegrated, the motion that is for a time retained, becomes more integrated; and so, considered dynamically, Evolution is a decrease in the relative movements of parts and increase in the relative movements of wholes — using the words parts and wholes in their most general senses. The advance is from the motions of simple molecules to the motions of compound molecules; from molecular motions to the motions of masses; and from the motions of smaller masses to the motions of larger masses.

The accompanying change towards greater multiformity among the retained motions, takes place under the form of an increased variety of rhythms. A multiplication of rhythms must accompany a multiplication in the degrees and modes of aggregation, and in the relations of the aggregated masses to incident forces. The degree or mode of aggregation will not, indeed, affect the rate or extent of rhythm where the incident force increases as the aggregate increases, which is the case with gravitation: here the only cause of varia-

tion in rhythm is difference of relation to the incident force; as we see in a pendulum which, though unaffected in its movements by a change in the weight of the bob, alters its rate of oscillation when its length is altered or when, otherwise unchanged, it is taken to the equator. But in all cases where the incident forces do not vary as the masses, every new order of aggregation initiates a new order of rhythm: witness the conclusion drawn from the recent researches into radiant heat and light, that the molecules of different gases have different rates of undulation. So that increased multiformity in the arrangement of matter, necessarily generates increased multiformity of rhythm; both through increased variety in the sizes and forms of aggregates, and through increased variety in their relations to the forces which move them. That these motions, as they become more integrated and more heterogeneous, must become more definite, is a proposition that need not detain us. In proportion as any part of an evolving whole segregates and consolidates, and in so doing loses the relative mobility of its components, its aggregate motion must obviously acquire distinctness. . . .

144. How in societies the movements or functions produced by the confluence of individual actions, increase in their amounts, their multiformities, their precision, and their combination, scarcely needs insisting upon after what has been pointed out in foregoing chapters. For the sake of symmetry of statement, however, a typical example or two may be set down.

At first the military activities, undifferentiated from the rest (all men in primitive societies being warriors) are relatively homogeneous, ill-combined, and indefinite: savages making a joint attack severally fight independently, in similar ways, and without order. But as societies evolve the movements of the thousands of soldiers which replace the tens of warriors, are divided and re-divided in their kinds of movements: here are gunners, there infantry, and elsewhere cavalry. Within each of the differentiated functions of these bodies there come others: there are distinct actions of privates, sergeants, captains, colonels, generals, as also of those who constitute the commissariat and those who attend to the wounded. The clustered motions that have thus become comparatively heterogeneous in general and in detail, have simultaneously increased in precision; so that in battle, men and the regiments formed of them, are made to take definite positions and perform definite acts at definite times. Once more, there has gone on that integration by which the multiform actions of an army are directed to a single end. By a co-ordinating apparatus having the commander-in-chief for its centre, the charges, and halts, and retreats are duly concerted; and a hundred thousand individual motions are united under one will.

Again on comparing the rule of a savage chief with that of a civilized government, aided by its subordinate local governments and their officers, down to the police, we see how, as men have advanced from tribes of hundreds to nations of millions, the regulative action has grown large in amount; how, guided by written laws, it has passed from vagueness and irregularity to comparative precision; and how it has subdivided into processes increasingly multiform. Or after observing how the barter that goes on among barbarians differs from our own commercial processes, by which a million's worth of commodities is distributed daily; by which the relative values of articles immensely varied in kinds and qualities are exactly measured, and the supplies adjusted to the demands; and by which industrial activities of all orders are so combined that each depends on the rest and aids the rest; we see that the kind of movement which constitutes trade, has become progressively more vast, more varied, more definite, and more integrated.

145. A finished conception of Evolution thus includes the re-distribution of the retained motion, as well as that of the component matter. This added element of the conception is scarcely, if at all, less important than the other. The movements of the Solar System have a significance equal to that which the sizes, forms, and relative distances of its members possess. The Earth's geographical and geological structure are not more important elements in the order of Nature than are the motions, regular and irregular, of the water and the air clothing it. And of the phenomena presented by an organism, it must be admitted that the combined sensible and insensible actions we call its life, do not yield in interest to its structural traits. Leaving out, however, all implied reference to the way in which these two orders of facts concern us, it is clear that with each re-distribution of matter there necessarily goes a re-distribution of motion; and that the unified knowledge constituting Philosophy, must comprehend both aspects of the transformation.

Our formula, therefore, needs an additional clause. To combine this satisfactorily with the clauses as they stand in the last chapter, is scarcely practicable; and for convenience of expression it will be best to change their order. On doing this, and making the requisite addition, the formula finally stands thus: — *Evolution is an integration of matter and concomitant dissipation of motion; during which the matter passes from an indefinite, incoherent homogeneity to a definite, coherent heterogeneity; and during which the retained motion undergoes a parallel transformation.*[1]

— HERBERT SPENCER,
First Principles of a New System of Philosophy (1862).

1. The definition of Evolution needs qualifying by introduction of the word 'relatively' before each of its antithetical clauses. The statement should be that '*the matter passes from a* relatively *indefinite, incoherent homogeneity to a* relatively *definite, coherent heterogeneity.*' . . .

[WALTER BAGEHOT ON SOCIAL EVOLUTION]

WHATEVER may be said against the principle of 'natural selection' in other departments, there is no doubt of its predominance in early human history. The strongest killed out the weakest, as they could. And I need not pause to prove that any form of polity is more efficient than none; that an aggregate of families owning even a slippery allegiance to a single head, would be sure to have the better of a set of families acknowledging no obedience to anyone, but scattering loose about the world and fighting where they stood. Homer's Cyclops would be powerless against the feeblest band; so far from its being singular that we find no other record of that state of man, so unstable and sure to perish was it that we should rather wonder at even a single vestige down to the age when for picturesqueness it became valuable in poetry.

But, though the origin of polity is dubious, we are upon the *terra firma* of actual records when we speak of the preservation of polities. Perhaps every young Englishman who comes now-a-days to Aristotle or Plato is struck with their conservatism: fresh from the liberal doctrines of the present age, he wonders at finding in those recognised teachers so much contrary teaching. They both — unlike as they are — hold with Xenophon — so unlike both — that man is the 'hardest of all animals to govern.' Of Plato it might indeed be plausibly said that the adherents of an intuitive philosophy, being 'the tories of

speculation,' have commonly been prone to conservatism in government; but Aristotle, the founder of the experience philosophy, ought, according to that doctrine, to have been a liberal, if anyone ever was a liberal. In fact, both of these men lived when men had not 'had time to forget' the difficulties of government. We have forgotten them altogether. We reckon, as the basis of our culture, upon an amount of order, of tacit obedience, of prescriptive governability, which these philosophers hoped to get as a principal result of their culture. We take without thought as a *datum*, what they hunted as a *quaesitum*. . . .

'The difference between progression and stationary inaction,' says one of our greatest living writers, 'is one of the great secrets which science has yet to penetrate.' I am sure I do not pretend that I can completely penetrate it; but it undoubtedly seems to me that the problem is on the verge of solution, and that scientific successes in kindred fields by analogy suggest some principles which wholly remove many of its difficulties, and indicate the sort of way in which those which remain may hereafter be removed too.

But what is the problem? Common English, I might perhaps say common civilised thought, ignores it. Our habitual instructors, our ordinary conversation, our inevitable and ineradicable prejudices tend to make us think that 'Progress' is the normal fact in human society, the fact which we should expect to see, the fact which we should be surprised if we did not see. But history refutes this. The ancients had no conception of progress; they did not so much as reject the idea; they did not even entertain the idea. Oriental nations are just the same now. Since history began they have always been what they are. Savages, again, do not improve; they hardly seem to have the basis on which to build, much less the material to put up anything worth having. Only a few nations, and those of European origin, advance; and yet these think — seem irresistibly compelled to think — such advance to be inevitable, natural, and eternal. Why then is this great contrast?

Before we can answer, we must investigate more accurately. No doubt history shows that most nations are stationary now; but it affords reason to think that all nations once advanced. Their progress was arrested at various points; but nowhere, probably not even in the hill tribes of India, not even in the Andaman Islanders, not even in the savages of Terra del Fuego, do we find men who have not got some way. They have made their little progress in a hundred different ways; they have framed with infinite assiduity a hundred curious habits; they have, so to say, *screwed* themselves into the uncomfortable corners of a complex life, which is odd and dreary, but yet is possible. And the corners are never the same in any two parts of the world. Our record begins with a thousand unchanging edifices, but it shows traces of previous building. In historic times there has been little progress; in prehistoric times there must have been much.

In solving, or trying to solve, the question, we must take notice of this remarkable difference, and explain it, too, or else we may be sure our principles are utterly incomplete, and perhaps altogether unsound. But what then is that solution, or what are the principles which tend towards it? Three laws, or approximate laws, may, I think, be laid down, with only one of which I can deal in this paper, but all three of which it will be best to state, that it may be seen what I am aiming at.

First. In every particular state of the world, those nations which are strongest tend to prevail over the others; and in certain marked peculiarities the strongest tend to be the best.

Secondly. Within every particular nation the type or types of character then and there most attractive tend to prevail; and the most attractive, though with exceptions, is what we call the best character.

Thirdly. Neither of these competitions is in most historic conditions intensified by extrinsic forces, but in some conditions, such as those now prevailing in the most influential part of the world, both are so intensified.

These are the sort of doctrines with which, under the name of 'natural selection' in physical science, we have become familiar; and as every great scientific conception tends to advance its boundaries and to be of use in solving problems not thought of when it was started, so here, what was put forward for mere animal history may, with a change of form, but an identical essence, be applied to human history.

At first some objection was raised to the principle of 'natural selection' in physical science upon religious grounds; it was to be expected that so active an idea and so large a shifting of thought would seem to imperil much which men valued. But in this, as in other cases, the objection is, I think, passing away; the new principle is more and more seen to be fatal to mere outworks of religion, not to religion itself. At all events, to the sort of application here made of it, which only amounts to searching out and following up an analogy suggested by it, there is plainly no objection. Everyone now admits that human history is guided by certain laws, and all that is here aimed at is to indicate, in a more or less distinct way, an infinitesimally small portion of such laws. . . .

A large part, a very large part, of the world seems to be ready to advance to something good — to have prepared all the means to advance to something good, — and then to have stopped, and not advanced. India, Japan, China, almost every sort of Oriental civilisation, though differing in nearly all other things, are in this alike. They look as if they had paused when there was no reason for pausing — when a mere observer from without would say they were likely not to pause.

The reason is, that only those nations can progress which preserve and use the fundamental peculiarity which was given by nature to man's organism as to all other organisms. By a law of which we know no reason, but which is among the first by which Providence guides and governs the world, there is a tendency in descendants to be like their progenitors, and yet a tendency also in descendants to *differ* from their progenitors. The work of nature in making generations is a patchwork — part resemblance, part contrast. In certain respects each born generation is not like the last born; and in certain other respects it is like the last. But the peculiarity of arrested civilisation is to kill out varieties at birth almost; that is, in early childhood, and before they can develop. The fixed custom which public opinion alone tolerates is imposed on all minds, whether it suits them or not. In that case the community feel that this custom is the only shelter from bare tyranny, and the only security for what they value. Most Oriental communities live on land which in theory is the property of a despotic sovereign, and neither they nor their families could have the elements of decent existence unless they held the land upon some sort of fixed terms. Land in that state of society is (for all but a petty skilled minority) a necessary of life, and all the unincreasable land being occupied, a man who is turned out of his holding is turned out of this world, and must die. And our notion of written leases is as out of place in a world without writing and without reading as a House of Commons among Andaman Islanders. Only one check, one sole shield for life and good, is then possible; — usage. And it is but too plain how in such places and periods men cling to customs because customs alone stand between them and starvation.

A still more powerful cause co-operated, if a cause more powerful can be imagined. Dryden had a dream of an early age, 'when wild in woods the noble savage ran'; but 'when lone in woods the cring-

ing savage crept' would have been more like all we know of that early, bare, painful period. Not only had they no comfort, no convenience, not the very beginnings of an epicurean life, but their mind within was as painful to them as the world without. It was full of fear. So far as the vestiges inform us, they were afraid of everything; they were afraid of animals, of certain attacks by near tribes, and of possible inroads from far tribes. But, above all things, they were frightened of 'the world'; the spectacle of nature filled them with awe and dread. They fancied there were powers behind it which must be pleased, soothed, flattered, and this very often in a number of hideous ways. We have too many such religions, even among races of great cultivation. Men change their religions more slowly than they change anything else; and accordingly we have religions 'of the ages' — (it is Mr. Jowett who so calls them) — of the 'ages before morality'; of ages of which the civil life, the common maxims, and all the secular thoughts have long been dead. 'Every reader of the classics,' said Dr. Johnson, 'finds their mythology tedious.' In that old world, which is so like our modern world in so many things, so much more like than many far more recent, or some that live beside us, there is a part in which we seem to have no kindred, which we stare at, of which we cannot think how it could be credible, or how it came to be thought of. This is the archaic part of that very world which we look at as so ancient; an 'antiquity' which descended to them, hardly altered, perhaps, from times long antecedent, which were as unintelligible to them as to us, or more so. How this terrible religion — for such it was in all living detail, though we make, and the ancients then made, an artistic use of the more attractive bits of it — weighed on man, the great poem of Lucretius, the most of a nineteenth-century poem of any in antiquity, brings before us with a feeling so vivid as to be almost a feeling of our own. Yet the classical religion is a mild and tender specimen of the preserved religions. To get at the worst, you should look where the destroying competition has been least — at America, where sectional civilisation was rare, and a pervading coercive civilisation did not exist; at such religions as those of the Aztecs.

At first sight it seems impossible to imagine what conceivable function such awful religions can perform in the economy of the world. And no one can fully explain them. But one use they assuredly had: they fixed the yoke of custom thoroughly on mankind. They were the prime agents of the era. They put upon a fixed law a sanction so fearful that no one could dream of not conforming to it.

No one will ever comprehend the arrested civilisations unless he sees the strict dilemma of early society. Either men had no law at all, and lived in confused tribes, hardly hanging together, or they had to obtain a fixed law by processes of incredible difficulty. Those who surmounted that difficulty soon destroyed all those that lay in their way who did not. And then they themselves were caught in their own yoke. The customary discipline, which could only be imposed on any early men by terrible sanctions, continued with those sanctions, and killed out of the whole society the propensities to variation which are the principle of progress.

Experience shows how incredibly difficult it is to get men really to encourage the principle of originality. They will admit it in theory, but in practice the old error — the error which arrested a hundred civilisations — returns again. Men are too fond of their own life, too credulous of the completeness of their own ideas, too angry at the pain of new thoughts, to be able to bear easily with a changing existence; or else, *having* new ideas, they want to enforce them on mankind — to make them heard, and admitted, and obeyed before, in simple competition with other ideas, they would ever be so natu-

rally. At this very moment there are the most rigid Comtists teaching that we ought to be governed by a hierarchy — a combination of *savans* orthodox in science. Yet who can doubt that Comte would have been hanged by his own hierarchy; that his *essor matériel*, which was in fact troubled by the 'theologians and metaphysicians' of the Polytechnic School, would have been more impeded by the government he wanted to make? And then the secular Comtists, Mr. Harrison and Mr. Beesly, who want to 'Frenchify the English institutions' — that is, to introduce here an imitation of the Napoleonic system, a dictatorship founded on the proletariat — who can doubt that if both these clever writers had been real Frenchmen they would have been irascible anti-Bonapartists, and have been sent to Cayenne long ere now? The wish of these writers is very natural. They want to 'organise society,' to erect a despot who will do what they like, and work out their ideas; but any despot will do what he himself likes, and will root out new ideas ninety-nine times for once that he introduces them.

Again, side by side with these Comtists, and warring with them — at least with one of them — is Mr. Arnold, whose poems we know by heart, and who has, as much as any living Englishman, the genuine literary impulse; and yet even he wants to put a yoke upon us — and, worse than a political yoke, an academic yoke, a yoke upon our minds and our styles. . . .

The true scientific method is to explain the past by the present — what we see by what we do not see. We can only comprehend why so many nations have not varied, when we see how hateful variation is; how everybody turns against it; how not only the conservatives of speculation try to root it out, but the very innovators invent most rigid machines for crushing the 'monstrosities and anomalies' — the new forms, out of which, by competition and trial, the best is to be selected for the future. The point I am bringing out is simple: — one most important pre-requisite of a prevailing nation is that it should have passed out of the first stage of civilisation into the second stage — out of the stage where permanence is most wanted into that where variability is most wanted; and you cannot comprehend why progress is so slow till you see how hard the most obstinate tendencies of human nature make that step to mankind.

Of course the nation we are supposing must keep the virtues of its first stage as it passes into the after stage, else it will be trodden out; it will have lost the savage virtues in getting the beginning of the civilised virtues; and the savage virtues which tend to war are the daily bread of human nature. Carlyle said, in his graphic way, 'The ultimate question between every two human beings is, "Can I kill thee, or canst thou kill me?"' History is strewn with the wrecks of nations which have gained a little progressiveness at the cost of a great deal of hard manliness, and have thus prepared themselves for destruction as soon as the movements of the world gave a chance for it. But these nations have come out of the 'pre-economic stage' too soon; they have been put to learn while yet only too apt to unlearn. Such cases do not vitiate, they confirm, the principle — that a nation which has just gained variability without losing legality has a singular likelihood to be a prevalent nation. . . .

Every nation is an 'hereditary co-operative group,' bound by a fixed custom; and out of those groups those conquer which have the most binding and most invigorating customs, and these are, as a rough rule, the best customs. The majority of the 'groups' which win and conquer are better than the majority of those which fail and perish, and thus the first world grew better and was improved.

This early customary world no doubt continued for ages. The first history delineates great monarchies, each composed of a hundred customary groups, all of

which believed themselves to be of enormous antiquity, and all of which must have existed for very many generations. The first historical world is not a new-looking thing but a very ancient, and according to principle it is necessary that it should exist for ages. If human nature was to be gradually improved, each generation must be born better tamed, more calm, more capable of civilisation — in a word, more *legal* than the one before it, and such inherited improvements are always slow and dubious. Though a few gifted people may advance much, the mass of each generation can improve but very little on the generation which preceded it; and even the slight improvement so gained is liable to be destroyed by some mysterious atavism — some strange recurrence to a primitive past. Long ages of dreary monotony are the first facts in the history of human communities, but those ages were not lost to mankind, for it was then that was formed the comparatively gentle and guidable thing which we now call human nature.

And indeed the greatest difficulty is not in preserving such a world but in ending it. We have brought in the yoke of custom to improve the world, and in the world the custom sticks. In a thousand cases — in the great majority of cases — the progress of mankind has been arrested in this its earliest shape; it has been closely embalmed in a mummy-like imitation of its primitive existence. I have endeavoured to show in what manner, and how slowly, and in how few cases this yoke of custom was removed. It was 'government by discussion' which broke the bond of ages and set free the originality of mankind. Then, and then only, the motives which Lord Macaulay counted on to secure the progress of mankind, in fact, begin to work; *then* 'the tendency in every man to ameliorate his condition' begins to be important, because then man can alter his condition while before he is pegged down by ancient usage; *then* the tendency in each mechanical art towards perfection begins to have force, because the artist is at last allowed to seek perfection, after having been forced for ages to move in the straight furrow of the old fixed way.

As soon as this great step upwards is once made, all or almost all, the higher gifts and graces of humanity have a rapid and a definite effect on 'verifiable progress' — on progress in the narrowest, because in the most universally admitted sense of the term. Success in life, then, depends, as we have seen, more than anything else on 'animated moderation,' on a certain combination of energy of mind and balance of mind, hard to attain and harder to keep. And this subtle excellence is aided by all the finer graces of humanity. It is a matter of common observation that, though often separated, fine taste and fine judgment go very much together, and especially that a man with gross want of taste, though he may act sensibly and correctly for a while, is yet apt to break out, sooner or later, into gross practical error. In metaphysics, probably both taste and judgment involve what is termed 'poise of mind,' that is the power of true passiveness — the faculty of 'waiting' till the stream of impressions, whether those of life or those of art have done all that they have to do, and cut their full type plainly upon the mind. The ill-judging and the untasteful are both over-eager; both move too quick and blur the image. In this way the union between a subtle sense of beauty and a subtle discretion in conduct is a natural one, because it rests on the common possession of a fine power, though, in matter of fact, that union may be often disturbed. A complex sea of forces and passions troubles men in life and action, which in the calmer region of art are hardly to be felt at all. And, therefore, the cultivation of a fine taste tends to promote the function of a fine judgment, which is a main help in the complex world of civilised existence. Just so too the manner in which the more

delicate parts of religion daily work in producing that 'moderation' which, upon the whole, and as a rule, is essential to long success, defining success even in its most narrow and mundane way, might be worked out in a hundred cases, though it would not suit these pages. Many of the finer intellectual tastes have a similar restraining effort; they prevent, or tend to prevent, a greedy voracity after the good things of life, which makes both men and nations in excessive haste to be rich and famous, often makes them do too much and do it ill, and so often leaves them at last without money and without respect.

But there is no need to expand this further. The principle is plain that, though these better and higher graces of humanity are impediments and encumbrances in the early fighting period, yet that in the later era they are among the greatest helps and benefits, and that as soon as governments by discussion have become strong enough to secure a stable existence, and as soon as they have broken the fixed rule of old custom, and have awakened the dormant inventiveness of men, then, for the first time, almost every part of human nature begins to spring forward, and begins to contribute its quota even to the narrowest, even to 'verifiable' progress. And this is the true reason of all those panegyrics on liberty which are often so measured in expression but are in essence so true to life and nature. Liberty is the strengthening and developing power — the light and heat of political nature; and when some 'Caesarism' exhibits as it sometimes will an originality of mind, it is only because it has managed to make its own the products of past free times or neighbouring free countries; and even that originality is only brief and frail, and after a little while, when tested by a generation or two, in time of need it falls away. . . .
